1 INTRODUCTION AND METHODS

MANAGING INFORMATION ON THE WORLD'S BIOLOGICAL DIVERSITY AT WCMC

The Earth's biological and other natural resources provide many economic, social and aesthetic benefits to mankind. This is particularly true of tropical forests which support over half the world's biological diversity, as well as provide much needed foreign exchange, and contribute to the livelihood of rural human populations in many developing countries. It is essential, therefore, that effective programmes for sustainable human development are based on conservation objectives. Responsible institutions and individuals need access to a service that provides factual information on the conservation status of the world's biological resources in a timely, focused and professional way.

This service is provided by the World Conservation Monitoring Centre, Cambridge, UK. Established in 1988 as a company limited by guarantee with charitable status, WCMC is managed as a joint-venture between the three partners in the World Conservation Strategy and its successor Caring for the Earth: IUCN - The World Conservation Union, UNEP - United Nations Environment Programme, and WWF - World Wide Fund for Nature. Its mission is to provide information on the status, security, management and utilisation of the world's biological diversity to support conservation and sustainable development.

To implement its mission, WCMC maintains substantial databases on the status and distribution of plant and animal species of conservation and development interest; habitats of conservation concern, particularly tropical forests, coral reefs and wetlands; the global network of conservation areas; and the international trade in wildlife species and their derivative products. Much of this information is managed using Geographic Information Systems, and is supported by an extensive bibliography of published and 'grey' literature. WCMC is also involved in providing support for the expansion of national data management capabilities in developing countries, and in developing communication networks for the flow of information.

WCMC contributes its data to GEMS - the Global Environment Monitoring System, coordinated by UNEP. GEMS is a collective programme of the world community to acquire, through global monitoring and assessment, the data that are needed for the rational management of the environment. GEMS is an element of the United Nations Earthwatch Programme.

Working closely with the IUCN Commission on National Parks and Protected areas since its inception in 1981, the WCMC Protected Areas Data Unit has compiled an extensive database of the world's conservation areas currently in excess of 30,000 records. Each record includes information on size, date of establishment, national designation, geographical coordinates, biogeographic province and, in the case of forest reserves, function. Boundaries of many of these conservation areas have been digitised from maps using a Geographic Information System, enabling them to be plotted and overlaid onto other georeferenced datasets for analytical and presentation purposes. In cases where maps of conservation areas are not available for digitising, the geographical coordinates can be used to plot their locations. This database, and associated digital files, has been expanded under the WCMC Tropical Managed Areas Assessment 1990 and forms the basis to the present report.

The WCMC Tropical Managed Areas Assessment 1990 is the first attempt to assess the contribution of the forestry sector to nature conservation. This assessment is therefore in many respects prototypical and in time could be significantly improved. This will require major improvements in the management of information on forestry sector data relating to protection and conservation, at the national level, and thus subsequently at the sub-regional, regional and global levels. In many instances this assessment has had to be carried out at two levels, based either on information that is derived from the site-specific level, or information that is only available at the aggregated system level. In the latter case, therefore, it is not possible to provide information on mean size and size distribution, location information, overlap with wildlife sector conservation areas, or precise numbers and areas of sites assigned to production, protection or conservation uses.

Future assessments could be made more comprehensive and more reliable if this detailed, site-specific information becomes available for both wildlife and forestry sectors.

HOW TO USE THIS REPORT

Findings from the WCMC Assessment are presented in this final report to the Overseas Development Administration, UK, which has funded the project. The report represents WCMC's contribution to the FAO Forest Resources Assessment 1990. It has been planned in close consultation with FAO so that its contents can be readily incorporated within or supplement the FAO Assessment. It comprises three parts as follows:

- Part I subregional reviews of managed areas in tropical countries for Asia & Pacific, Africa, and Latin America;
- Part II regional and global overview of managed areas for each of the three tropical regions (Asia & Pacific, Africa, and Latin America), based on the subregional reviews in Part I; and
- Part III maps and lists of managed areas for each tropical country.

The report is intended to be a source of information and analysis rather than to be read from cover to cover. The primary means of accessing this information is through the Contents list. Before dipping into the main body of the report, the reader is urged to browse Section 1.2 on Methods which not only explains how the information has been collected and compiled, but also draws attention to its limitations.

The subregional reviews in Part I, which include summary statistics for individual countries, have been compiled according to a standard format to enable comparisons to be made directly between countries and subregions. Each subregional section is self-contained, complete with bibliography and annexes in which summary data on the forest estate are presented and conservation areas are listed. The exceptions are the country maps of managed and conservation areas which, because of their larger A3-size, are presented separately in Part III. The conservation areas listed in Annexes X.1 of the subregional sections are cross-referenced to the maps in Part III, enabling the location of individual sites to be identified from the maps. Sources of maps with annotations are provided in Section 1 of Part III. Part II comprises regional and global reviews based on summary details extracted from each subregional section in Part I.

A number of terms have been used which have very specific meanings so far as this report is concerned. Examples include forest land, managed area, conservation area, forestry sector, wildlife sector and total area. These and others are defined in the Glossary at the end of Section 1.

Finally, this report is largely a review and analysis of information contained in the four-volume series *Protected* areas of the world: a review of national systems prepared by WCMC and published by IUCN for the IV World Parks Congress, Caracas, 10-21 February 1992 (IUCN, 1992). Referencing of the text in this report has been kept to a minimum, thereby avoiding repetition of the extensive bibliographies contained in the four-volume series. These should be consulted for much of the background information on national conservation area networks, with details of their legislative and administrative basis, and of their representativeness.

ACKNOWLEDGEMENTS

Production of this report has been based largely on the substantial conservation areas database and associated digital maps that WCMC manages, supplemented by a massive pantropical data gathering exercise. This information is drawn from an extensive network of conservation area professionals within forestry and wildlife authorities, as well as those within scientific institutions and conservation bodies. WCMC wishes to express its thanks to these individuals and their agencies, too numerous to mention individually, for their support without which it would be unable to operate. WCMC recognises with particular gratitude the fundamental contribution of the IUCN Commission on National Parks and Protected Areas, whose commitment to WCMC over the years has helped the Centre to develop its capability in managing information on the world's conservation areas. WCMC also acknowledges the support of the IUCN Forest Conservation Programme, which was instrumental in initiating this project, and the IUCN Environmental Law Centre for its help with information on conservation areas legislation.

Staff at WCMC involved in the *Tropical Managed Areas Assessment 1990* include Mike Adam, Clare Billington, Simon Blythe, Gillian Bunting, Daphne Clark, Graham Drucker, Harriet Gillett, Donald Gordon, Michael Green, Thomas Moriarty, James Paine, Corinna Ravilious, Deborah Rothera, Joel Smith, Mark Spalding and Alison Suter. The project has been managed by Jeremy Harrison and coordinated by Michael Green with assistance from Clare Billington and James Paine.

The WCMC Tropical Managed Areas Assessment 1990 has been funded entirely by the Overseas Development Administration of the UK under Research Scheme No. 4544. Particular thanks are due to staff within the Natural Resources and Environment Department who have supported this initiative through its various stages.

WCMC has welcomed the opportunity to integrate this project with the FAO Forest Resources Assessment 1990. The support of Dr K D Singh, its coordinator, and his colleagues is greatly appreciated.

1 INTRODUCTION AND METHODS

1.1 INTRODUCING THE WCMC TROPICAL MANAGED AREAS ASSESSMENT

1.1.1 Background

The clearance of tropical forests, both rain forests and dry forests is an issue at the top of the environmental agenda. Most tropical forest occurs within developing nations where pressures are greatest from burgeoning populations to exploit this resource for its products and convert forest land to agriculture. Meanwhile, developed nations are concerned that such forests contain half the world's species, as well as playing an important role in maintaining global climatic stability.

In order to assess the status of tropical forests (and woodlands) and identify trends in deforestation and afforestation, FAO and UNEP conducted a survey of tropical forest resources in 76 tropical countries in 1978-1981 (FAO, 1981). It was concluded from the *Tropical Forest Resources Assessment 1980* that human population growth and agricultural expansion are the main causes of deforestation in the tropics. The 1980 Assessment was instrumental in mobilising global support for the *Tropical Forestry Action Plan* which aims to stem, and eventually reverse, the process of deforestation and forest degradation in the tropics.

Much of this deforestation and degradation is unmanaged, uncontrolled and unsustainable, providing no longterm benefits to the local people involved. An integrated approach to land-use is needed whereby: forests are converted to agriculture only where soils are rich; they are managed for minor forest products for the benefit of local people as well as for timber production; and they are selectively protected in order to maintain ecological services, genetic resources and biological diversity. Such protection forests are a vital resource for local people, and are being managed increasingly for the direct benefit of local communities on whom ultimately depends the future integrity and maintenance of conservation area systems.

1.1.2 FAO Forest Resources Assessment 1990

Aware of the need to improve and update the baseline information gathered under the 1980 Assessment in order to keep governments and the international community informed of the state of tropical forest resources, FAO is carrying out an assessment for 1990 (FAO, 1990). The FAO Forest Resources Assessment 1990 complements the new round of assessments of forest resources in temperate countries conducted under the auspices of the FAO/ECE Timber Committee in Geneva for the reference year 1990. It was also intended that the scope of the 1990 Assessment would be expanded to include non-tropical developing countries, where trends in deforestation and degradation are linked with processes of desertification as well as with pressure from agriculture and inadequate management. However, this part of the 1990 Assessment has not yet been funded.

It was generally recognised that the 1980 Assessment was over-concerned with commodity production, notably timber, and that more emphasis should be given to the service functions of forest, including environmental protection and nature conservation. This is being addressed by the WCMC Tropical Managed Areas Assessment 1990 which is designed to quantify the environmental services of tropical forests (particularly with respect to conservation areas) and form an integral part of the FAO Forest Resources Assessment 1990. Efficient integrated land-use is essential to ensuring that local people benefit from available forest resources. Hence the importance of the WCMC Assessment in helping to ensure that conservation areas are considered by resource-use planners to be efficient forms of land-use.

1.1.3 WCMC Tropical Managed Areas Assessment 1990

Tropical forests have long been valued for their timber, on account of which governments of many countries have either nationalised them or developed extensive networks of forest reserves to safeguard them from overexploitation and conversion to other forms of use. Such provisions have often proved inadequate due to a lack of proper management practices and enforcement measures in the face of ever mounting pressures on forests for their timber and potential agricultural land. While attention within the forestry sector has been focused primarily on their timber production value, with exploitation all too frequently occurring at unsustainable levels, there has been a growing awareness of the ecological values of tropical forests as centres of biological diversity and endemism, and for watershed management. Increasingly, countries in Latin America, Africa and Asia have been allocating forest reserves or parts thereof to protect watersheds and conserve biological resources. But quite how much tropical forest is reserved for such protection and conservation purposes within the forestry sector is not known.

The WCMC Tropical Managed Areas Assessment 1990 is a three-year project (July 1989-June 1992) funded by the Overseas Development Administration, UK under Research Scheme No. R4544. It is being carried out in collaboration with IUCN - The World Conservation Union, in particular its Forest Conservation Programme and Commission on National Parks and Protected Areas, and in cooperation with the Food and Agricultural Organization of the United Nations to compliment its Forest Resources Assessment 1990.

Its overall objective is to complement the FAO Forest Resources Assessment 1990 by quantifying the contribution of forestry, wildlife and other sectors to nature conservation in the tropics. This will help to identify gaps in existing managed and conservation area networks and, particularly with respect to the forestry sector, highlight the need for increased allocation of tropical forests for protection and conservation purposes.

Under the terms of the ODA Memorandum, the specific objectives of the WCMC Tropical Managed Areas Assessment 1990 with respect to "each of the countries covered by the [FAO] Tropical Forest Resources Assessment Project" are as follows:

- to update information held by WCMC on conservation area systems, and to expand its information on managed areas other than those established primarily for nature conservation, particularly with respect to forest reserves managed for sustainable resource use;
- to present this information in short accounts of the state of national managed and conservation area systems, drawing the main conclusions into regional summaries;
- to map managed and conservation area systems on a Geographic Information System;
- to use this GIS facility to analyse the coverage of different vegetation types or bioclimatic units by managed and conservation areas, and to examine the coverage afforded to different regions by those systems;
- to prepare analyses of managed area coverage by forest type and management category, and present this in a form that is compatible with the FAO Forest Resources Assessment 1990 tables and reports; and
- to prepare further analyses and reports as time permits.

These objectives have been met, with the exception of the analysis of vegetation/bioclimatic types, and findings are presented in this report and in the four-volume series *Protected Areas of the World: A Review of National Systems* (IUCN, 1992), compiled by WCMC. The latter country-by-country review of the world's conservation areas was produced for the IV World Parks Congress, Caracas, 10-21 February 1992 under a separate but related project funded by British Petroleum. It comprises descriptions, lists and maps of national conservation area networks. A considerable amount of information on national conservation area networks generated from the WCMC Assessment has been incorporated within this series, which provides the basis of the present report.

It has not been possible to examine coverage of the different vegetation/bioclimatic types by managed and conservation areas within the available time. It has been WCMC's intention throughout the project to base this analysis on the ecofloristic zone maps of the tropics produced for FAO by the Institut de la Carte Internationale de la Végétation, Université Paul Sabatier, Toulouse. Such maps have been available for tropical Asia (Sharma, 1986a) and Africa (Sharma, 1986b) for some time, but those for parts of Latin America have still to be completed. WCMC did not acquire the digital datasets of ecofloristic zones for Asia, Africa and Latin America (excluding Central America and Mexico) from FAO until the penultimate month of the project. Subsequent technical problems with the geo-referencing of the digital ecofloristic zone data sets precluded an analysis based on protected areas data sets.

It is still planned to assess the representativeness of the managed and conservation area networks with respect to ecofloristic zones, but in the months immediately following completion of this report. This study will be carried out in close cooperation with FAO and the results presented in a separate report.

1.1.4 Status of the FAO Assessment and its implications on the WCMC Assessment

The FAO Assessment has changed in several respects from those originally specified in the *Guidelines for* Assessment (FAO, 1990), due to inadequate information and a lack of additional funding. Changes which have directly affected the scope of the WCMC Assessment are as follows:

- it will cover only tropical countries, with the exception of those in Insular Africa (other than Madagascar) and Oceania which have been dropped due to paucity of data. Thus, the FAO Assessment currently covers only 100 out of the 130 tropical countries originally identified for inclusion. These are listed in Annex 1.1;
- it is not being extended to an additional 30 non-tropical developing countries as originally anticipated because of a lack of further funding; and
- it is no longer planned to produce a series of country briefs due to the lack of a comprehensive response from tropical countries.

In view of the these constraints and developments, the WCMC Assessment has necessarily been modified in order to maintain its consistency with the FAO Assessment. It includes 100 of the 101 geopolitical units covered by the FAO Assessment (Saint Pierre and Miquelon, listed by FAO under the Caribbean subregion is excluded from the WCMC Assessment), *plus* those five countries in Oceania which have a significant amount of forest (i.e. Fiji, Papua New Guinea, New Caledonia, Solomon Islands and Vanuatu), and Bermuda as listed in Annex 1.1.

The FAO Assessment will officially end in October 1992 with the completion of a series of regional reports covering Asia, Africa and Latin America. It is anticipated that this report will supplement the FAO regional reports, or be incorporated within them. A preliminary, summary version of Part II of this report has already been presented to FAO for inclusion within its report to the United Nations Conference on the Environment and Development (FAO, 1992).

1.2 METHODS

1.2.1 Scope

The WCMC Tropical Managed Areas Assessment 1990 covers 106 tropical geopolitical units. These are split into 12 subregions and three tropical regions (Latin America, Africa and Asia & Pacific), as shown in Annex 1.1.

The scope of the WCMC Assessment was initially wider, covering a total of 163 geopolitical units in line with the FAO Forest Resources Assessment 1990. It included all those in Insular Africa and Oceanian subregions and extended to non-tropical developing countries. Government agencies within 158 of these geopolitical units were approached for information during the early stages of the project. But it was subsequently trimmed in line with changes within the FAO Assessment, as explained above (Section 1.1.4).

The study is focused on *managed areas*, particularly those having a protection or conservation role which are referred to as *conservation areas* in this report. These terms are defined in the Glossary. It is directed primarily at the forestry and wildlife sectors, within which occur the majority of managed areas. Additional sectors are covered where appropriate.

No attempt has been made to exclude managed areas notified after 1990 from the WCMC Assessment because this would not affect the analysis significantly. The number of records of sites established post-1990 is only 119, which is less than 0.5% of all the sites recorded on the WCMC database as having been established prior to 1990.

1.2.2 Data collection

Forestry sector Prior to this assessment, WCMC' information on managed areas in the forestry sector had been patchy, with good coverage of a few countries and scant or no data for the majority. Managed areas in the forestry sector are used predominantly for production purposes and, therefore, are of secondary interest to WCMC, as compared to those areas under protection and conservation management regimes.

For the purpose of this study, it was necessary for WCMC to contact forest administrations in every tropical country, often for the first time. Administrations were asked for statistics and maps of the forest estate, information relating to its management and copies of relevant legislation. A standard letter was drafted in consultation with colleagues in the IUCN Forest Conservation Programme and the FAO Assessment, translated into French and Spanish, and circulated to all forest administrations using the list of *Heads of National Forestry*, *Wildlife and Parks Administrations* maintained by the FAO. Attached to the letter were two tables which these authorities were requested to fill in. The English version of the standard letter and tables is shown in Annex 1.2.

Letters to forest administrations in 158 tropical and non-tropical developing countries (or geopolitical units) were sent out during the second quarter of 1990. Responses were received initially from 20% of countries, but, following reminder letters being sent in December, the response rate had increased to 40% by April 1991. As previously mentioned (Section 1.1.4), the scope of the project was reduced to 100 tropical countries following changes made to the FAO Assessment in mid-1991, and WCMC's efforts in the latter part of 1991 and early 1992 concentrated on soliciting responses outstanding from among these tropical countries. By the end of this project, 52% of tropical countries had responded (Table 1.1). The level of response was remakably even, ranging from 48% in Tropical Latin America to 56% in Tropical Africa. A number of reasons may account for this relatively disappointing level of response. First, many of the countries in this assessment have extremely meagre financial resources dedicated to forestry and wildlife activities, and staff may not have been available to compile the information requested. Secondly, as a related issue, it is likely that the detailed information on individual sites, maps etc. may not be available, even within the countries themselves. This indicates the importance of supporting and building information gathering and management capacity within countries.

Information obtained directly from forest administrations was supplemented with data gathered under the FAO Assessment, particularly in the case of those which did not respond to WCMC's requests. In the absence of any recent data, and as a last resort, statistics were used from the *Tropical Forest Resources Assessment 1980* (FAO, 1981) with respect to quantifying the extent of natural forest under production. Additional information on the forestry sector was obtained from the libraries of the FAO Forest Department, Rome and the Oxford Forestry Institute. Copies of much of the forest legislation relevant to managed areas were obtained from the FAO Forest Resources Division.

Wildlife sector WCMC already holds an extensive body of information on conservation areas within the wildlife sector. This information has been gathered over many years as a result of direct contact with the appropriate government and other agencies responsible for their management. It is continuously being updated as existing areas are upgraded in their conservation status or enlarged, and as new ones are created.

Relevant agencies within all tropical countries were contacted at some stage during the WCMC Assessment for their latest lists and maps of conservation areas, or asked to check and update such material generated from the WCMC Protected Areas Database and Biodiversity Map Library. Much of this information-gathering exercise was conducted under the auspices of compiling *Protected areas of a world: a review of national systems* (IUCN, 1992), with relevant data feeding directly into the WCMC Assessment. As explained in Section 1.1.3, these two projects complement each other.

Level of response from forest administrations in tropical countries to requests for information on managed areas initially made in March-June 1990. At least two reminders were sent over the subsequent two years to those administrations which did not respond.

REGION	No. countries	No. countries responding	Response level
TROPICAL ASIA & PACIFIC			· · · ·
South Asia	7	3	43 %
Continental South East Asia	5	2	40%
Insular South East Asia	5	4	80%
Oceania	5	2	40%
Subtotal	22	11	50%
TROPICAL AFRICA			
West Sahelian Africa	9	3	33 %
East Sahelian Africa	6	4	67%
West Africa	8	6	75%
Central Africa	7	2	28%
Tropical Southern Africa (+ Madagascar)	11	8	73%
Subtotal	41	23	56%
TROPICAL LATIN AMERICA			
Central America (+ Mexico)	8	3	38%
Caribbean	25	14	56%
South America	10	21	40%
Subtotal	43	21	48%
TOTAL	106	55	52%

Maps Where possible, maps of managed areas were obtained from the relevant government authorities within the forestry, wildlife and any other sectors in order to digitise their boundaries using a Geographic Information System. In addition, the map libraries of the University of Cambridge and Oxford Forestry Institute were searched for maps of managed areas. Maps were also obtained from the Natural Resources Institute of the Overseas Development Administration (ODNRI) and Hunting Technical Services, UK.

1.2.3 Data management

WCMC manages its information on conservation areas in the following ways:

- hard copies of bibliographic material (books, papers, reports, legislation etc), correspondence with raw data, and maps are filed on a geographic basis;
- relevant data are extracted from this raw material and stored electronically in the WCMC Protected Areas Database or, in the case of maps, digitised using a Geographic Information System and stored within the WCMC Biodiversity Map Library; and
- texts describing national conservation area networks, their legal and administrative basis, are compiled using a standard format and stored electronically. (Texts describing individual conservation areas are also compiled, and stored in the same way, but these are not relevant to this study.)

For purposes of the WCMC Assessment, the WCMC Protected Areas Database was expanded to include other managed areas, notably forest reserves. A number of modifications were made to the database to enable the function of forest reserves to be recorded as production, protection or conservation, in line with the classification used by FAO (1990). This database currently comprises some 31,000 records, of which some 9,136 are relevant to the WCMC Assessment. An example of the type of output which can be generated from the Protected Areas Database are the lists of conservation areas presented in Annex X.2 of respective subregional chapters within Part I of this report.

Summary statistics of the forest estate provided by respective forest administrations in Table 1 of Annex 1.2 at the request of WCMC were entered into a series of worksheets within a Lotus 1-2-3 spreadsheet. Output from this database appears as Annex X.1 of respective subregional chapters.

Maps of managed areas were digitised using mainly ARC.INFO but also ATLAS*GIS software, in the latter stages of the project. Digital files are stored within the WCMC Biodiversity Map Library.

1.2.4 Analysis and review of information

This is described below for each part of the report. Limitations with the data are discussed in italics as appropriate.

PART I

The way in which data are generated, analysed and presented is described below for each section of the subregional chapters.

X.1 Historical Perspective Reviews the way in which nature conservation has evolved through legal and administrative regimes, based on informaton contained in *Protected areas of the world: a review of national systems* (IUCN, 1992).

- X.2 Nature Conservation Policy and Legislation Reviews current nature conservation policy and legislation within forestry, wildlife and other sectors, based on information contained in *Protected areas of the world: a review of national systems* (IUCN, 1992). Table X.1 has been compiled by extracting the relevant data from the Annex of legal designations in IUCN (1992). The sector to which individual pieces of legislation apply (i.e. forestry, wildlife or additional) is indicated, together with management objectives for each designation as legislated or laid down in policies.
- X.3 Managed Areas Administration Reviews current administration within forest, wildlife and other additional sectors based on information in *Protected areas of the world: a review of national systems* (IUCN, 1992).
- X.4 Managed Areas Status Data on managed areas originates from two databases, namely the WCMC Protected Areas Database (Annex X.1), and the Lotus 1-2-3 spreadsheet with the responses from forest administrations (Annex X.2).

Data in Table X.2, showing the extent of natural forest land under production, protection and conservation, are derived directly from Annex X.2. It should be noted that, whereas statistics for individual protection and conservation forests were collected as part of the WCMC Assessment, this was not extended to production forests. Data presented in Annex X.2 are often subject to a number of limitations, due to the way in which statistics are compiled nationally, as follows:

- It is not always possible to distinguish between the different forest origins. For example, data for natural forest may occasionally include plantation forest.
- It is frequently difficult to differentiate between protection and conservation forest as countries do not necessarily follow the classification system drawn up by FAO (1990). In the final analysis, this does not affect the WCMC Assessment as both protection and conservation forest are treated similarly as conservation areas.
- It is not always known whether or not raw data for protection and conservation forest, as supplied by forest administrations, include conservation areas managed by the wildlife sector. Where this is known to be the case, the raw data have been modified by subtracting the contribution of the wildlife sector.

These and other deficiencies reflect the availability of national statistics, or the way in which they are compiled, and are noted at the foot of the tables in Annex X.2.

Coverage The WCMC Protected Areas Database was used to generate statistics for analysing the coverage of national conservation area networks in terms of total and partial protection, and assessing the relative contribution of the forestry, wildlife and additional sectors. These statistics are presented in **Table X.3**. The analysis extends to all existing and proposed conservation areas, irrespective of their size, but managed areas under productive regimes are excluded. It does not extend to privately-owned and managed reserves. Coverage by national conservation area networks is expressed as a percentage of the total area of a country, and examined in relation to the widely-accepted target of 10%. This is considered to be a realistic goal for many countries, taking into account other demands on land for economic development and subsistence needs. Coverage expressed as a percentage of total area can be misleading, however, in the case of the countries with widely scattered islands and having a marine component that is well represented within the conservation area network. This discrepancy arises because total area accounts for land and inland water bodies only, and not territorial waters.

The representativeness of conservation area networks is examined with respect to major habitats, and gaps identified from other studies are highlighted. Particular attention is given to whether or not plans based on systematic surveys have been formulated to ensure that the full range of a country's biological diversity is represented within its conservation area network.

Integrity Mean size and the frequency distribution of conservation area sizes are used as a measure of the integrity of conservation area networks (Table X.4). This, by necessity, is based only on data where the extent of individual conservation areas is known. Thus, agreggated data that may be included in Table X.2, Table X.3 or Annex X.2 will not appear. Given that, in effect, conservation areas have been increasingly established as islands in a sea of humanity, they should be theoretically as large as possible to maximise the degree to which their contents retain their integrity (Soulé, 1983). Thus, the effectiveness of a conservation areas network in maintaining biological diversity will partly be a function of the size of its constituent units. For example, conservation areas need to be large enough to support minimum viable populations of key species. These should consist of at least 500 genetically effective individuals, or a total population of about 1,000 individuals including juveniles and other non-breeders (Soulé, 1986). The optimal size of a conservation area will vary with respect to the key species under protection, but the many sites that contain populations of threatened large mammals need to extend over several tens or hundreds of thousands of hectares, respectively, for ungulates or carnivores at the top of their food chains.

The effectiveness with which conservation areas are managed is assessed qualitatively, based largely upon information from *Protected areas of the world: a review of national systems* (IUCN, 1992).

- X.5 Future Prospects Official proposals to expand conservation area networks are reviewed, based on statistics presented in Table X.3. The many new conservation areas recommended by authorities other than the responsible management agencies, such as consultants representing non-governmental organisations and aid agencies, are excluded from the analysis. Other national initiatives to strengthen networks through specific projects and programmes, to overcome economic constraints through funding mechanisms, and to improve management through new approaches are reviewed. Participation in international and regional conventions and programmes, particularly with respect to the Convention concerning the World Cultural and Natural Heritage (World Heritage Convention), the Convention on Wetlands of International Importance especially as Waterfowl Habitat (Ramsar Convention) and the Unesco Man and the Biosphere Programme is reviewed (Table X.5), together with attempts between adjacent countries to manage conservation areas under cooperative agreements.
- X.6 Priorities for Action These are necessarily broad and may not be comprehensive, but the priorities identified in this report are summaried in Table X.6.

PART II

The analyses in Part II are essentially similar to those described above for Part I, but carried out at the regional and global level, rather than subregional level. This is intended to summarise the major trends across each of the three continental regions, and at a global level. It is by necessity a summary document dealing with generalisations, and should be read in conjunction with appropriate sub-regional reports, where much greater detail and elaboration is provided.

PART III

This part of the report consists entirely of maps of managed areas of each country generated from the WCMC Biodiversity Map Library. Maps show the boundaries of existing managed areas, where known, or their centre points if only their geographic coordinates are known. Proposed managed areas are not mapped. Different hatching patterns are used to distinguish between the following:

- managed areas under production and conservation areas within the forestry sector.
- conservation areas within the forestry sector and those within the wildlife and any other additional sectors.

Conservation areas are numbered on the maps; these numbers correspond to the numbers in the respective lists for each country in Annex X.2 of the subregional reports. Not all conservation areas are mapped because the

locations of some sites are not known. This is evident by comparing the numbers in Annex X.2 with those in the maps.

Managed areas under production are mapped, if the information is available, but they are not individually named by cross-referencing to the list in Annex X.2 as in the case of conservation areas.

The source material from which the maps are derived is given at the beginning of Part III on a country-bycountry basis.

Maps are based on the best available information. Sometimes this may be ten or more years old, as in the case of Atlas of Forest Resources of India published by the Government of India in 1976. This was used as the source for digitising India's forest reserves. In this particular case, there has been relatively little change (4%) in the total area of reserved forests, from 39.8 million ha in 1976 (Government of India, 1984) to 41.5 million ha in 1991 (Forest Survey of India, 1992), and boundaries of many forest reserves may not have changed significantly. Sometimes it has been possible to obtain copies of digital files, for example, most South American countries. In the case of Indonesia, a full set of film positives of Map 9 Land Cover and Suggested Forest Zoning, The Land Resources of Indonesia - A National Overview - Atlas was obtained from the Natural Resources Institute of the Overseas Development Administration, but unfortunately these could not be digitised for technical reasons. Sources used in the production of maps are given at the beginning of Part III.

Annex 1.2 Letter to heads of all forest administrations in developing countries

Dear

FAO Forest Resources Assessment 1990

The World Conservation Monitoring Centre, in cooperation with the IUCN Tropical Forest Programme, is currently gathering information on protected and managed forests in tropical/developing countries for incorporation into the <u>Forest Resources Assessment 1990</u> being implemented by FAO under the framework of the Tropical Forestry Action Plan.

The last such survey undertaken by FAO was in 1980, in response to concern about the depletion and degradation of tropical forests and woodlands throughout the world. That assessment covered 76 tropical countries and provided a set of quantitative estimates on forest resources and deforestation rates. The findings were instrumental in mobilising global support for the Tropical Forestry Action Plan, the aim of which is to reverse the process of deforestation and forest degradation in the tropics.

As you are aware, FAO is carrying out a further assessment, working to a baseline of 1990. In the new assessment explicit emphasis will be given to reviewing the service functions of forests, including environmental protection and nature conservation. It is necessary, therefore, to examine the extent to which tropical forests and woodlands have been assigned a conservation role through their protection as national parks, wildlife sanctuaries and the like, or as certain categories of forest reserve. WCMC is working closely with FAO in preparing this part of the Assessment, with the support of the Overseas Development Administration of the UK.

Information is needed on the forest reserve system within your country. It would be very much appreciated if the following details could be provided by the end of May 1990:

- 1. statistical data summarising the extent of the forest reserve network as shown in Table 1.
- a map (Scale 1:1 million is preferred, complete with projection e.g. Mercator and latitude and longitude registration marks) showing the distribution of the forest reserve network, with all forests reserved for protection or conservation purposes (e.g. protection of watersheds and water catchments, nature conservation) named and their boundaries marked;
- a register of protection and conservation forests to be cross-referenced to the above map (2), with details
 of size, date of notification etc. as shown in Table 2.

In addition, it would be helpful if you could also provide the following:

- copies of forestry legislation and policy relevant to the general establishment of forest reserves (but copies of legislation dealing with the notification of individual reserves is not needed);
- 5. precise definitions of the different categories of forest reserves, if not covered by the above (4);
- details of recently introduced or proposed conservation measures within the forestry sector (e.g. bans on logging above specified altitudes or gradients, total bans on logging or raw log exports); and
- 7. a copy of the forest department annual report. It would be most helpful if WCMC could be put on your department's mailing list for future issues.

Your help is greatly appreciated and if there is any way in which we might be able to reciprocate with information, please do not hesitate to contact us.

Yours sincerely

WCMC Tropical Managed Areas Assessment 1990

Table 1 National forest reserve network - summary information

Please complete the table below in the manner illustrated by the example, or supply an official listing annotated as appropriate with the information requested. Any policies relevant to the protection of forests should be entered as a footnote to the table as shown below.

For the purposes of the FAO Forest Resources Assessment 1990, forest function is classified according to the following definitions:

Production forests - areas which support sustained production of wood.

Protection forests - areas, other than conservation forests, which in practice cannot support sustained wood production because the terrain is unsuitable (eg too steep or rugged, subject to flooding).

Conservation forests - areas designated for conservation.

NAME OF COUNTRY/STATE: e.g. Gondwanaland MONTH/YEAR OF REFERENCE:

e.g. December 1989

National designation - Class	Forest Function Prod. Prot. Cons.	No. reserves	Area (ha)	
Forest Reserves		126	3,783,417	
- Protection Forests	+	28	999,777	
- Commercial Forests ^{1/2}	+	38	2,674,576	
- Amenity Forests	+	11	20,767	
- Virgin Jungle Reserves	+	49	88,306	

¹ No logging permitted above 2,000m: this amounts to an area of c.198,000 ha.

² No logging permitted in the coastal zone: this amounts to an area of c.143,000 ha

Nat. designation - Class - Name of site	Geog. coord.	Size (ha)	Date notified	Notification No.	Forest type ¹	Has logging ever occurred in the past? If so, give last date.

GLOSSARY

This highly selective glossary provides definitions of some of the less familiar or more technical terms used in this report.

Alienable forest land Forest land available for transfer to other forms of land use (FAO, 1990).

Conservation forest Areas within the forestry sector designated for conservation by law or other regulations (FAO, 1990).

Conservation area Defined as for protected area. [The term conservation area is used instead of protected area with which it is synonymous.]

Forest land An area of land proclaimed to be forest under a Forest Act or Ordinance (FAO, 1990).

Forest reserve Generally well-defined, surveyed, demarcated and legally constituted forest under the control of a forest department. All acts of felling, collection of forest produce, grazing and even trespassing are usually prohibited unless expressly permitted by law (FAO, 1981).

Forestry sector That part of government responsible for the protection and management of forest land.

Land area Refers to total area excluding the area under inland water bodies, these being major rivers and lakes. [Data are taken from the FAO Production Yearbook.]

Managed area A legally designated natural area managed for production on a sustainable basis or for conservation purposes. The term includes conservation area and is frequently used generically when referring to reserves within the forestry sector that may have a production and/or conservation function.

Natural forest Forest composed of tree species known to be indigenous to the area. Included in this definition are primary forest (undisturbed), disturbed primary forest associated with various intensities of selective logging, secondary forest resulting from logging of primary forest, logged over forest with under-planting of exotics, and managed forest regenerated artificially or naturally so long as this involves the renewal of essentially the same crop as before (FAO, 1990).

Notified forest Forest land that is notified as reserved. N.B notified forests are usually demarcated, the boundaries being given in the notification.

Plantation forest refers to forest established artificially by afforestation on lands which previously did not carry forest within living memory, or by reforestation of previously forested land involving the replacement of indigenous species by new and essentially different species or genetic varieties (FAO, 1990).

Production forest Forest having terrain and soil conditions suitable for the production of wood and other products on a sustainable basis. The distance to consumption or export centres is not taken into account, which means that economically inaccessible forests are included in this class (FAO, 1990).

Protected area An area of land and/or sea managed through legal or customary regimes so as to protect and maintain biological diversity and natural and associated cultural resources. [This definition was agreed at the IV World Parks Congress on National Parks and Protected areas, Caracas, 10-12 February 1992. The term protected area is not used in this report, conservation area being preferred.]

Protected forest Similar to forest reserve in so far as being notified, demarcated and under the control of a forest department. However, the degree of control exercised is generally of a low order and nearby villagers usually have rights to grazing and collection of forest produce for their own consumption (FAO, 1981).

Protection forest Areas within the forestry sector located on terrain that is too steep or rough, or subject to periodic or permanent inundation, which makes forest management impractical due to physical non-productivity (FAO, 1990).

Total area Refers to the total area of a country, including the area under inland water bodies. [Data are taken from the FAO Production Yearbook.]

Unclassed forest Forest land which is publicly owned but lacks any well-defined legal status (FAO, 1981).

Unclassified forest Forest land other than that legally reserved or that which is alienable, i.e. the rest (FAO, 1990).

Wildlife sector That part of government responsible for nature conservation.

SUBREGIONAL REVIEWS

6 WEST SAHELIAN AFRICA

,

6 WEST SAHELIAN AFRICA

Burkina Faso, Cape Verde, Chad, Gambia, Guinea-Bissau, Mali, Mauritania, Niger, Senegal

6.1 HISTORICAL PERSPECTIVE

Archaeological records indicate that from about 8000 BC until about 2,500 BC the subregion enjoyed a much more humid climate than exists today. The first evidence of agriculture occurs around 8000 BC. From about 4000 BC pastoralists established the main elements of existing pastoral production. By the standards of the time, the Sahel was both populous and prosperous. Until the 1890s Sahelian agriculture and pastoralism remained virtually unchanged; its historical impact on the environment is immeasurable, but the negative effects of shifting cultivation, bush fires, charcoal production and grazing of the pre-colonial era seem insignificant when set against the environmental degradation of the last 100 years (Cross, 1990).

Protection of nature in the West Sahel has a long history. Before the colonial period land rights were essentially self-determining. Individual communities allocated land, under the guidance of village elders, according to family needs and the land's agricultural or pastoral potential, rather than being appropriated by individuals.

Over-exploitation was limited due to various factors. Low levels of population enabled fallow periods to extend to 10 years or more. Sanctuaries of sacred woods were respected and fruit trees (karité, néré, baobab) were protected. Relatively secret magic-fetish sects imposed regulations concerning hunting. Although hunting permits did not exist, animals were not killed without permission having first been received from the village chief at a public ceremony. Contravention of these regulations could lead to heavy penalties, even to offenders being sold as slaves.

With the imposition of colonial rule, this traditional system of land tenure changed to a hierarchical one, with political and economic decision-making being invested in non-Africans, or their appointees (Cross, 1990).

Protection of nature within the subregion this century is still strongly influenced by the countries' colonial histories. The subregion comprises six francophone countries (Burkina Faso, Chad, Mali, Mauritania, Niger and Senegal), and the Gambia and Cape Verde (previously British and Portuguese colonies, respectively).

6.2 NATURE CONSERVATION POLICY AND LEGISLATION

Legal provisions for the establishment of protected areas have been passed in all countries within the region since their independence, with the exception of Cape Verde. These legal provisions are summarised in Table 6.1 and reviewed below.

6.2.1 Forestry Sector

Forest policy and forest law in colonial Africa were based on experience from continental Europe. In the francophone counties within the subregion, forest policy and law were derived directly from France and France's long experience of temperate forestry. In the British colony of the Gambia, the early administrators adopted the pattern of reservation of forest lands applied in British India, with the legal establishment of a permanent forest estate, the boundaries and use of which could only be amended by the highest authority in the land.

Policy Information concerning current forest policy is only available for the Gambia and Chad. In the Gambia, main objectives of forest policy are: to reserve and maintain a national forest resource capable of protecting natural ecosystems and providing an adequate supply of wood and other forest products for the rural population; to maintain a Forestry Service staffed with trained personnel; to administer the forest resources; and to foster conservation awareness amongst the Gambian people. In Chad, conservation and management of classified forests is included in the 1976 Manifesto of N'Diamena.

Legislation passed during the colonial period, relating to countries within the subregion, includes two decrees relevant to managed areas. These comprise a decree establishing the forestry regime in French Equatorial Africa (which included Chad, Cameroon, Central African Republic and Gabon), and a decree of 4 July 1935 established the forestry regime in French West Africa (which comprised Benin, Cote d'Ivoire, Guinea, Mali and Senegal).

The original French forestry legislation was based on the principle of Roman legislation. According to this, unoccupied land, where existence of written ownership documents could not be proved, belonged to the state. All forest lands were thus declared state property, although local populations exercised many rights of use. Contradiction between the oral customary law and these written regulations led to a general reluctance of local people to accept the delineation of reserved forests.

Categories established in common throughout francophone countries in the subregion were classified forest and protected forest. Since independence, all these countries have promulgated new forestry law, based on the earlier French legislation. Forest land is still considered to be state property, and the terms of classified forest (gazetted areas in which customary rights of use are permitted) and protected forest (areas not gazetted in which, generally, all felling is prohibited) continue to be used.

In Chad, where separate wildlife law has not been promulgated, classified forests are subdivided into strict nature reserves, national parks and other designations, following those defined in the African Convention of 1968. In both Chad and Mauritania, protection forests include all areas on slopes greater than 35°.

In Guinea-Bissau, previously a Portuguese territory, current forest legislation is the 1963 Regulamento Florestal. Forestry law in the Gambia reflects previous British administration, which often recognised the claims of local populations to forest ownership.

6.2.2 Wildlife Sector

Policy Information on wildlife policy in Burkina Faso, Cape Verde, Mauritania, Niger and Senegal is not available.

In both the countries (Chad and the Gambia) for which information is available, recognition is given of the importance of the countries' flora and fauna, and the importance of conservation areas in helping to maintain these.

In Chad, the 1976 Manifesto of N'Djamena reflects the country's awareness of the cultural, scientific and economic importance of its natural resources and wildlife. Steps to be taken to ensure the preservation of its natural heritage are listed, including conservation and management of national parks, faunal reserves, classified forests and other natural reserves. It is also stated in the manifesto that the country relies on assistance from other countries and international organisations with nature conservation.

In the Gambia, the government's commitment to the conservation of flora and fauna, including the setting aside of protected natural habitats, is stated in the Banjul declaration of 1977. A national conservation strategy is under preparation in Guinea-Bissau, in collaboration with IUCN, with particular attention being paid to coastal zone management and the development of a protected areas network.

Legislation The first piece of wildlife legislation within the subregion was the Wild Animals (Birds and Fish) Preservation Act of 1916 in the Gambia. A decree of 18 November 1947 controlled hunting in all French overseas territories. Under French colonial law, the Decree of 10 March 1925 provided for the establishment of refuge parks in French West Africa. Wildlife legislation has been promulgated in Burkina Faso, the Gambia, Guinea-Bissau, Mali, Mauritania, Niger and Senegal. Present nature conservation legislation in the subregion provides for the establishment of national parks, strict nature reserves, wildlife sanctuaries, hunting reserves and sport hunting reserves. Definitions of these designations are similar for all countries in the subregion, and follow those given in the African Convention of 1968. The highest degree of protection is afforded to strict nature reserves, where access is permitted only for management purposes and scientific research. National parks are open to visitors, but residence is not permitted. In Guinea-Bissau, there is as yet no comprehensive protected areas legislation.

6.2.3 Other Sectors

Not applicable

6.3 MANAGED AREAS ADMINISTRATION

The management authority for each category of protected area is listed in Table 6.1. Categories are listed according to the language used in the original legislation. A glossary of terms (French, Portuguese and Spanish) is given in Part I.

6.3.1 Forestry Sector

Administration of forestry is the responsibility of forest departments in the respective countries (Table 6.1). In general, management is the responsibility of respective administrative districts, each under a Divisional Forest Officer.

6.3.2 Wildlife Sector

Conservation areas have traditionally been managed under a single administrative organisation within the forest departments of the respective countries within the subregion (Table 6.1). Although information concerning this is limited, this situation still appears to hold true.

6.3.3 Additional Sectors

No information

6.3.4 Non-Governmental Organisations

In general, non-governmental organisations are not involved directly in protected areas administration. An exception is Takieta Forest Reserve in Niger, where management has been passed to SOS Sahel, an environmental charity which supports community action that focuses on the conservation of natural resources and sustainable agricultural production.

6.4 MANAGED AREAS STATUS

The managed areas system is mapped for each country within the subregion in Fig 6.1-9 (Part III). Details of individual conservation areas are given in Annex 6.1 which serves as a key to the maps.

6.4.1 Forestry Sector

Coverage Data for the subregion concerning the forestry sector are incomplete, hence available data underestimate the role played by the forestry sector. Information concerning the extent of legally constituted forest reserves by forest origin and forest function, for each country, is given in Annex 6.2. Managed areas within the forestry sector account for a minimum 4.3% of the total area of the West Sahel (Table 6.2).

6.4.2 Conservation Areas within Forestry and Wildlife Sectors

Coverage There are some 271 legally designated conservation areas in the region covering a total area of 39.8 million ha or 7.4% of the region (Table 6.3). Approximately 21 of these conservation areas are under total protection, covering 11.8 million ha or 2.2% of the subregion. The rest are partially protected. The forestry sector is directly responsible for some 212 conservation areas, covering a total area of 18,263,307ha or 3.4% of the region.

Representativeness of the protected areas system within the region varies widely. The extremes are Senegal, with an extensive, well-planned system of protected areas which is generally considered to be adequate, and Cape Verde, which still has no protected areas.

Burkina Faso, Niger and Chad are similar in that each country has one enormous reserve in the Sahel zone, covering at least 5% of the country, and a considerably greater percentage of each country's protected areas system. These systems are, therefore, relatively limited in the degree to which they represent each country's variety of habitats. Air et Ténéré National Nature Reserve in Niger is the largest protected area in Africa under active management, and covers over 6% of the country. Similarly, Chad has a huge reserve, Ouadi Rime-Ouadi Achim Faunal Reserve, which occupies over 6% of the country. In Burkina Faso, the Sahel Partial Faunal Reserve covers 5% of the extreme north of the country, a region of relatively little conservation interest. In the south of the country there are a few smaller reserves, but virtually none of the central part of the country is represented. In contrast, Mali and Mauritania, although having little area protected, do have well located protected areas of particular importance to migratory birds. Mali has three small Ramsar sites in the Inner Niger Delta, whilst in Mauritania, Ramsar sites are situated along the coast. Protected areas in Guinea-Bissau are distributed throughout the country, but in reality exist only on paper. The Gambia has only a small area protected for conservation.

Ecofloristic zone analysis [pending data from FAO]

Integrity Data in Table 6.4 indicate that, with the exception of the Gambia, conservation areas under the wildlife sector tend to be large. Mean size of totally protected areas is similar to that of partially protected areas. Mean size of conservation areas within the forestry sector tend to be far smaller throughout the subregion.

Effectiveness War or armed violence has seriously disrupted or destroyed protected areas management in Chad. In general, conservation areas within the region are largely ineffective. Apart from inadequate representation of the subregion's biological diversity within existing conservation area networks, conservation efforts are limited by: weaknesses in policy and legislation; inadequate institutional support and ineffective (or non-existent) management. Management plans for protected areas within the region, do not, in general, exist. Funds have not been sufficient to allow for effective management in any of the countries within the subregion apart from the Gambia and Senegal. Senegal has taken a very firm line on poaching, in spite of which it still remains a problem. Management of protected areas in the Gambia is, in general, good. In Chad, two decades of desertification and fighting have led both to serious degradation of the land, and to a virtual absence of any information concerning the status of the protected areas.

Enforcement is often handicapped by the absence of clearly-demarcated boundaries that are easily recognisable on the ground. Encroachment by people is ubiquitous, few conservation areas being free of this problem.

Desertification in the subregion has seriously hampered attempts to establish effective managed areas (Cross, 1990; IUCN, 1989).

6.4.3 Contribution of the Forestry Sector to Nature Conservation

Data in Table 6.2 suggest that the contribution of the forestry sector to nature conservation is negligible (1.1%) in terms of the total area of the subregion under protection and conservation forest. It should be noted that data is incomplete, and the contribution of the forestry sector to protection and conservation is presumably much higher than suggested by these statistics. Over 54 % of the conservation area network falls within the domain of the wildlife sector (Table 6.3).

Classified forests in francophone countries were originally established as conservation forests, mostly in the 1930s, 1940s and 1950s. However, comments from some administrative bodies imply that these classified forests now fulfil a productive function; hence, they appear in Table 6.2 under the heading of production rather than conservation or protection forests. In general, lists of forest reserves serving a conservation purpose within the subregion were not available; hence, the forestry sector appears to play a negligible role in conservation in the subregion.

The role played by protected forests in francophone countries should also be considered. They comprise virtually all state land lying outside individually gazetted areas, with regulations such that they serve a conservation purpose. Unfortunately, estimates of the area covered by these protected forests are in no instance available.

6.5 FUTURE PROSPECTS

6.5.1 Expanding the Conservation Area Network

Official proposals to expand the conservation area network are minimal. They total some 2.5 million ha or 0.5% of the total area of the subregion (Table 6.3). Proposals exist for the protected areas systems to be expanded in most countries in the region. Proposals exist for the establishment of a substantial protected areas system in Guinea-Bissau.

6.5.2 Other National Initiatives

Strengthening networks

No information

Overcoming Economic Constraints Funding is a major factor which limits the effective management of conservation areas throughout the subregion, although the situation is less severe in Senegal and the Gambia. In these countries, conservation areas are playing an increasingly important role in the developing tourism industries.

Improving Management

6.5.3 International Initiatives

Conventions and Programmes All countries within the subregion participate in one or more international conventions and programmes concerned with conservation areas (Table 6.5). All countries except Chad and Burkina Faso have ratified or accepted the Convention Concerning the World Cultural and Natural Heritage (World Heritage Convention). Mali, Mauritania, Niger and Senegal have properties inscribed on the World Heritage list. All countries except Cape Verde and the Gambia have acceded to or ratified the Convention on Wetlands of International Importance Especially as Waterfowl Habitat (Ramsar Convention). All countries except Cape Verde are party to the African Convention 1968. Biosphere reserves have been designated in Burkina Faso, Mali and Senegal.

Senegal and Burkina Faso are the only two African countries to have signed the Convention on the Conservation of Wildlife and Natural Habitats (Bern Convention) which is of particular importance to migratory birds.

Cooperative Agreements The Lake Chad Basin Commission, uniting representatives of four countries (Chad, Cameroon, Niger, Nigeria) bordering the lake, was established in 1964, although no information is available concerning its relevance to conservation areas. Chad has undertaken bilateral negotiations with the Central African Republic (Central Africa sub-region) and the Sudan (East Sahelian sub-region). Again, information is not available as to whether these negotiations concern conservation areas.

A Conseil d'Entente with Niger, Burkina Faso, Côte d'Ivoire and Togo provides an administrative structure for cooperation between neighbouring countries. A proposal to set up a single authority to manage the three contiguous "W" national parks in Burkina Faso, Benin and Niger, totalling over 1 million ha, and to raise funds for its operation, is being considered.

6.6 PRIORITIES FOR ACTION

Priorities for conservation action in the subregion were identified in the now dated IUCN Systems review of the Afrotropical Realm (MacKinnon and MacKinnon, 1986), the subsequent Action Strategy (IUCN, 1987), and in The IUCN Sahel Studies 1989.

Priorities have been reviewed more recently (IUCN, 1992) for the IVth World Congress on National Parks and Protected Areas. These are generalised, recognising that translation of priorities into action will vary according to national conservation objectives, history and political will. They provide a foundation to the more specific priorities identified in this report and summarised in Table 6.6. The Sudano-Sahelian PLATFORM for Action on UNCED Negotiations and Beyond: A Contribution to the African Position (Anon, 1191), concerning environmental degradation within the Sahel, was drawn up for UNCED 1992, following two consultative meetings of 22 Sudano-Sahelian countries, which included participants from all countries within the subregion. The report highlights the link between poverty and mismanagement of natural resources, particularly exploitation of marginal lands and deforestation. Recommendations include action to be taken at both the international and African level.

In conclusion, progress in the subregion has been seriously hampered by environmental conditions (i.e. drought), civil unrest, and the demand on resources by rapidly growing human populations. Although mostly aware of the need for conservation area networks, well-funded institutions and up-to-date policy and legislation, governments in the subregion have generally not been able to ensure these are established.

Summary of national priorities for action relating to conservation areas. Table 6.6

COUNTRY	Legislation	Completing the network	Managing the network
Burkina Faso		Expand protected area system to include example of remaining unmodified Sahel vegetation. Upgrade three reserves to national park status.	Improve management by promoting greater participation of local communities in wildlife protection
Cape Verde	Enact legislation	Establish a reserve on the island of Raso	Create an administration
Chad		Expand network to include examples of vegetation types that are currently inadequately represented, including <i>Isoberlinia</i> -dominated woodland and swamps	Restore management when peace returns to the country
Gambia		Expand system to protect mangrove swamps	Improve management by training staff, providing equipment and adequate wages
Guinea-Bissau	Enact proposed Loi sur la conservation de la nature	Establish representative network	Implement management
Mali		Expand protected area system to include examples within the Saharan zone and its habitats	Improve management by increasing staff numbers and providing adequate finance
Mauritania		Expand protected area system to include a Ramsar site in the northern part of the Senegal River delta, and extend Banc d'Arguin NP to incorporate Cap Blanc	Implement Banc d'Arguin management plan. Improve management of Banc d'Arguin and Plateau d'El Aguer
Niger		Protect an area of swamp vegetation and extend protection within wooded grassland and Sudanian woodland	Improve management to control illegal grazing, mining and deforestation
Senegal		Network is adequate	Improve management

7 EAST SAHELIAN AFRICA

7 EAST SAHELIAN AFRICA

Djibouti, Ethiopia, Kenya, Somalia, Sudan, Uganda

7.1 HISTORICAL PERSPECTIVE

Protection of nature in the form of local customs and laws is an old tradition throughout the subregion, one notable example being the protection of "kayas" or coastal forests as sacred groves in Kenya. More formally, the establishment of managed areas began with the reservation of forests at the turn of the century in Kenya and Uganda, although the majority were established in the 1930s in Uganda and Sudan, the 1940s in Kenya, the 1950s in Somalia, and the early 1980s in Ethiopia. There are currently no forest reserves in Djibouti. Within the forest reserve networks of Uganda and Kenya, nature reserves have been created which afford a high degree of protection to flora and fauna.

Following the early establishment of game reserves in Kenya in 1898, and the first national park, Forêt du Day in Djibouti, in 1939, all countries of the subregion currently have conservation areas within the wildlife sector. Further, all countries, with the exception of Uganda, have passed post-independence legislation providing for the creation of conservation areas, mostly during the late 1960s and 1970s.

In at least half the countries of the subregion the administration of forest reserves and conservation areas in the wildlife sector originally fell to the same organisation, and in Uganda game reserves were initially created from forest reserves. Today, all countries have distinct forestry and wildlife agencies, although within a number of countries these agencies are collaborating their efforts to ensure the effective management of conservation areas.

7.2 NATURE CONSERVATION POLICY AND LEGISLATION

Legal provisions for the creation and management of conservation areas exist in all East Sahelian countries. These are summarised in Table 7.1 and reviewed below.

7.2.1 Forestry Sector

Policy Current forestry policy throughout the subregion reflects the dual purposes of protection and management for sustainable use. For example, one aim of the forest policy of Kenya, as contained within sessional paper No. 1 of 1968, is to draw up management plans for all forests, based on the principle of sustained yield. Further, policy statements for Somalia emphasise the preservation of forestry and wildlife resources for the benefit of the Somalian people, the creation of protected areas, and the preparation of management plans combining production and conservation.

The need to increase the area under reservation is also reflected in a number of statements. In Uganda, emphasis is placed on the maintenance of enough forest land to ensure sufficient supplies of timber, to allow for amenity and recreation, and to ensure the conservation of plants and animals in natural ecosystems. The forest policy also specifies that 20% of the total reserved forest area is to be conserved in strict nature reserves, and a further 30% protected from intensive forms of forest management in buffer zones. Similarly, a forest law and policy was drafted for Sudan in 1989 which, together, are to provide for production and protection functions within forest reserves, and specify that 20% of the land area is to be protected eventually in the forest reserve network.

Legislation Current forestry legislation dates back to 1932 when the Central and Provincial Forest acts were passed in Sudan. A new forest law, drafted in 1989, is, however, likely to replace these early laws. The 1940s witnessed the enactment of modern-day forestry laws in Kenya and Uganda, which have subsequently been revised numerous times. Forestry laws in Somalia and Ethiopia were passed in 1969 and 1980, respectively. All of these laws generally provide for one or more categories of reserve, together with provisions for forest exploitation and management practices, establishment of a management authority, the creation and management

of forest reserves at the local level, and offences and accompanying penalties in connection with forest resources and reserves. Related and subsidiary legislation to the principal acts exists for most countries, notable among these being the Presidential Decree of 1986 which banned all logging in Kenya, and the Penal Code Proclamation of Ethiopia (1957) which has several provisions related to forest and wildlife conservation, and reserved lands.

Somalia and Ethiopia are unique in that provisions relating to the creation and management of forest reserves and conservation areas in the wildlife sector are contained within the same legislation. Other countries have distinct wildlife and forestry laws. The forestry laws of Kenya and Uganda, however, make provision for the establishment of more protective nature reserves within forest reserves. A number of forest reserves in Uganda have dual status as national parks, game reserves or sanctuaries.

In Uganda and Somalia, the need for revised and expanded legislation providing for protected areas has been recognised, while national forest priority areas are awaiting legal gazettement in Ethiopia. Forestry legislation *per se* does not exist in Djibouti.

7.2.2 Wildlife Sector

Policy Most countries have formulated, or are in the process of developing nature conservation policies. For example, Kenya's commitment to conservation was stated in Sessional Paper No. 3, 1975: Statement on Future Wildlife Management Policy in Kenya, which made provision for optimising returns from the wildlife resource, coherent planning of projects and wildlife programmes, and defined the role of national parks. More encompassing is Somalia's Mogadishu Manifesto on the Conservation of Wildlife, 1989, which embodies current government policy, formulating the basis for all future development projects and activities in various fields pertaining to Somali wildlife. In contrast, the need for a new conservation policy with clear objectives for effective management of conservation areas has been recognised in both Uganda and Sudan.

Legislation Within the subregion, the majority of countries had pre-independence laws relating to the creation of conservation areas. Early examples include the Kenya National Parks Ordinance of 1945, the Sudan National Parks, Sanctuaries and Reserves Regulations of 1939, and legislation dealing with the establishment of game reserves in Uganda in 1902. These were subsequently amended or repealed, most recently in the 1970s (Somalia) or 1980s (Djibouti, Kenya, Ethiopia, Sudan). As of 1990, Somalia was considering new draft legislation, while Uganda has recognised the need for legislation to replace that passed in the 1950s and 1960s.

In the 1970s, Southern Sudan was given a measure of autonomy, and legislation passed in 1972 created the categories of national park, game reserve and controlled area for the Southern region. Legislation passed in 1986, however, provides for the establishment and management of conservation areas throughout the country and replaces the earlier laws.

Present nature conservation legislation in the subregion commonly provides for the establishment of national parks, game reserves, sanctuaries, and controlled hunting areas, while Somalia also has a grazing reserve designation. National parks tend to afford the highest degree of protection, and controlled hunting areas the least throughout the subregion. In Kenya, Somalia, and Uganda, laws were passed in the late 1970s which completely banned hunting.

7.2.3 Additional Sectors Not applicable

7.3 MANAGED AREAS ADMINISTRATION

7.3.1 Forestry Sector

Administration of forestry is the responsibility of forest departments in the respective countries, with the exception of Sudan, where forestry matters fall under the mandate of the National Forestry Corporation (Table

7.1). Most have a long institutional history, for example, Sudan where the first Forest Department was created in 1901.

In Ethiopia, the State Forest Conservation and Development Department is responsible for the establishment and management of national forest priority areas, while peasant associations and urban dwellers associations are responsible for natural resources, including forests, within their areas of local jurisdiction. In Kenya, trust land forests are managed by the county councils, while other forest reserves are managed by the Forest Department. Management of forests under the National Forestry Corporation of Sudan is mostly confined to the north of the country due to the ongoing civil war.

Management of conservation areas, apart from forest reserves serving a protection or conservation function, falls outside the forestry sector, the exceptions being nature reserves in Kenya, and nature reserves and sites of special scientific interest in Uganda. In Kenya, nature reserves are managed jointly by the Forest Department and Kenya Wildlife Service, while the Game Department in Uganda has jurisdiction over wild animals in all forest reserves and maintains field staff in some of the larger reserves. Further, several forest reserves in Uganda have dual status as national parks or game reserves and are therein managed jointly by forestry and wildlife sectors.

ć

7.3.2 Wildlife Sector

The management of conservation areas in the wildlife sector is the responsibility of one organisation in Ethiopia (Ethiopian Wildlife Conservation Organisation), and by two or more agencies in the other five countries of the subregion. In Sudan, for example, management jurisdiction lies with the Wildlife Conservation and National Park Forces in the Northern Region and with the Regional Ministry of Wildlife Conservation, Fisheries and Tourism in the Southern Region, while in Somalia three agencies are involved: the National Range Agency in the southern and northern regions; the Central Rangelands Development Project in the central region; and the Ministry for Jubba Valley Development, in conjunction with the National Range Agency, in the Middle Jubba. Although most conservation areas in the wildlife sector of Kenya are managed by the Kenya Wildlife Service, national reserves are administered by district councils. Djibouti is unique to the subregion in having a research institute assist with the management of conservation areas.

7.3.3 Additional Sectors

Not applicable

7.3.4 Non-Governmental Organisations

The Somali Ecological Society is currently managing Balcad Nature Reserve.

7.4 MANAGED AREAS STATUS

The managed areas system is mapped for each country within the subregion in Fig. 7.1. Details of individual conservation areas are given in Annex 7.1 which also serves as a key to the maps. The bulk (about 95% total area) of the conservation areas network falls within the domain of the wildlife sector.

7.4.1 Managed Areas within the Forestry Sector

Coverage Natural reserved forests account for about 0.8% of the total area of the subregion (Table 7.2). They are most extensive in Uganda (5.4%) and Kenya (2.5%), respectively. Currently, no natural forests are legally reserved in Djibouti, while the situation in Somalia is unclear.

Of the 0.8% of natural reserved forests in the subregion, more than half serves a conservation or protection function (Table 7.2). All forest reserves in Kenya are considered conservation forests by virtue of a countrywide ban on logging in 1986, while of the more than 700 notified reserves in Uganda, conservation forests constitute 63% of the forest estate, and a further 9% is protection forest. When legally established, the national forest priority areas of Ethiopia will be zoned into management blocks for production, conservation and protection purposes.

7.4.2 Conservation Areas within Forestry, Wildlife and Additional Sectors

Coverage There are more than 800 notified conservation areas in the East Sahel, covering 43.3 million ha or 8.3% of total area (Fig. 7.1). The forestry sector is directly responsible for over 600 conservation areas, covering approximately 2.4 million ha or 0.4% of total area for the subregion. All of these lie in Kenya (>200 forest reserves) and Uganda (>460 forest reserves) (Table 7.3).

Approximately 9% of conservation areas are under total protection, covering 3.0% of area in the subregion (Table 7.3). Most of these fall within the wildlife sector. The rest are partially protected.

The target of 10% of total area under protection for conservation purposes has been reached by Uganda (23.7%), Ethiopia (15.9%), and Kenya (10.3%). The Sudan is half-way towards reaching the target. Least extensive are the networks of Djibouti (0.4%) and Somalia (0.8%). About 73% of the conservation area in Ethiopia, and over 50% of lands in Uganda, however, is tied up in game sanctuaries and controlled hunting areas which make minimal provision for habitat protection and are designated essentially for hunting purposes.

Representativeness Nature conservation areas have often been established haphazardly in the past, with little regard to ecological or other criteria for their selection. This is reflected in the existing networks of Djibouti, with dense forest habitats needing further protection (Welch & Welch, 1985), and Ethiopia where a number of important ecosystems are largely unprotected (Friis & Tadesse, 1990). A number of programmes and plans, however, have been formulated which recommend an expansion to the conservation areas network in Ethiopia.

In Kenya, national parks and conservation areas in the wildlife sector are found in the majority of habitat types for the country. The largest proportion of these, however, are found in arid and semi-arid regions (Pertet, n.d.). In response to this, the Kenya Wildlife Service is striving to create a national network of conservation areas and is developing a systems plan (KWS, 1990). Within the forestry sector, the establishment of a further 500,000ha in forest reserves is awaiting legal notification.

In Somalia there is an urgent need to establish a conservation areas system, made almost impossible by the current security problems and drought. The majority of conservation areas in Sudan are in savanna woodlands, found mainly in the inaccessible south, and no conservation areas occur in desert and Sahelian zones which make up half the country (Stuart & Adams, 1990).

Uganda is considered to have a good system of parks and reserves. Nevertheless, 25 out of 94 non-aquatic ecosystems are totally unprotected or only have small portions within forest or wildlife reserves. To afford a greater degree of protection, the Forestry Department has recently created a number of sites of special scientific interest, and is currently looking to expand nature reserves from 5% to 20% of total reserved forest area (Forest Department, pers. comm., 1990; Howard, 1988).

Integrity Using mean size as a measure of integrity, data in Table 7.4 indicate that forest reserves serving a conservation or protection function in Kenya tend to be small, the majority being less than 1,000ha in size. Similarly, the totally protected nature reserves of Kenya and Uganda have a mean size of less than 6,000ha. In the wildlife sector, established conservation areas in Sudan and Ethiopia tend to be large, with totally protected areas in Sudan having a mean size greater than one million ha. Partially protected areas in Uganda and Somalia have a mean in excess of 120,000ha, while those of Kenya are less than 60,000ha. Significantly, however, totally protected areas in Uganda and in particularly, Kenya, are a respectable size, having a mean larger than 100,000ha. Conservation areas in Djibouti tend to be on the small side.

The mean size of partially protected areas (7,050ha) in the forestry sector, made up exclusively of forest reserves, is almost twice that of totally protected areas (4,675ha). This reflects the relatively small size of nature reserves in the subregion. In the wildlife sector, the mean size of totally protected areas (282,395ha) is slightly larger than that for partially protected sites (239,242ha). National parks constitute the bulk of the former category, and by definition tend to be relatively large areas to provide a range of services. Partially

protected areas comprise mainly game reserves, controlled hunting areas, and sanctuaries. Significantly, conservation areas in the wildlife sector tend to be considerably larger than those in the forestry sector.

Effectiveness Apart from gaps in the representation of the subregion's biological diversity within existing conservation area networks, conservation efforts are limited by weaknesses in policy and legislation, inadequate institutional support and ineffective management.

As mentioned in Section 7.2, nature conservation policies in both the forestry and wildlife sectors have been formulated or are in the process of being drafted or amended for all countries of the subregion, the exception being Djibouti.

For a number of countries, legislation needs strengthening or updating. For example, existing forestry laws need to be reviewed in Kenya, and regulations enacted in Ethiopia to allow for the legal establishment of conservation areas and national forest priority areas. New definitions for the various types of conservation areas in the wildlife sector also need to be established in Ethiopia. In Somalia, the need for new legislation covering all aspects of forestry and wildlife has been recognised. As such, a wildlife law was drafted in 1990 which makes provision for a number of conservation area designations, and it has been recommended that complimentary forestry legislation be prepared. Security problems in a number of countries of the subregion have frequently hampered the enactment of conservation areas legislation.

Institutional resources for conservation area management are inadequate in all countries within the subregion. Constraints include a lack of adequately trained staff, funds, resources, and scientific information upon which to base sound management decisions. These problems are most acute in Ethiopia, Somalia and Sudan, while the situation in Uganda is gradually improving after years of political turmoil. Further hindrances to conservation areas management are poor communication and transportation networks in a number of countries. Conservation areas management is further complicated where forestry and wildlife agencies are both involved: the need for, and often lack of coordinated management in Kenya's nature reserves is a prime example.

Low priority and a general lack of commitment of resources for conservation areas is largely responsible for many of the deficiencies in their management. This situation is exacerbated by countries having an unclear programme or weak planning of their conservation area networks. Very few conservation areas in the subregion have management plans, and for those which do exist, they are largely out-of-date or difficult to implement. For example, the management plans for conservation areas in Uganda have been mostly forgotten and never acted upon, while all working plans for forest reserves in the country are out-of-date. The majority of conservation areas in Somalia, Sudan, and to a lesser extent Ethiopia, exist on paper only, while the boundaries of conservation areas in the wildlife sector of Uganda and protected forests in Somalia are ill-defined.

Common threats to the subregion's conservation areas include poaching, expansion of human settlements, illegal grazing, shifting cultivation, unauthorised extraction of timber, fuelwood and minor forest products, uncontrolled bushfires, and, in the cases of Sudan and Kenya, dams and irrigation schemes. These threats are compounded by a rapidly growing population in the subregion, civil unrest in a number of countries, and famine in drought-stricken areas.

7.4.3 Contribution of the Forestry Sector to Nature Conservation

Data in Table 7.2 indicate that the contribution of the forestry sector to nature conservation is minimal (0.5%) in terms of the total area of the subregion under protection and conservation forest. Although data for Somalia are missing, it is likely that the contribution of this country to the total would not be significant (<0.1\%). In contrast, about 95% of the conservation area network falls within the domain of the wildlife sector, covering 7.9% of total area of the subregion (Table 7.3).

7.5 FUTURE PROSPECTS

7.5.1 Expanding the Conservation Area Network

Official proposals to expand the conservation area network total 9.3 million ha, or 1.8% of the total area of the subregion (Table 7.3). Two-thirds of this is proposed in the wildlife sector, with the majority of sites to be afforded partial protection. Improvements to the network affect 1.6 million ha in Sudan, 2.4 million ha in Ethiopia, and 4.6 million ha in Somalia. Proposed areas in Ethiopia already exist as *de facto* national forest priority areas which serve protection and production functions.

Other significant extensions to existing national networks are planned for Sudan and Kenya. Proposals for 20% of reserved forest lands to be designated as nature reserves in Uganda will afford protection to the entire variety of ecosystems within forest reserves, include medium altitude forest and critical sites of biological diversity (Howard, 1988; Pomeroy, 1990).

7.5.2 Other National Initiatives

Strengthening networks A variety of initiatives to strengthen conservation areas planning and management is being implemented or formulated. Following the National Programme for the Conservation and Management of Forests, Wildlife, Soils and Water and its Tropical Forestry Action Plan, Ethiopia has demarcated 58 national forest priority areas and is considering the establishment of a number of wildlife reserves and national parks. Under the Kenya Indigenous Forest Conservation Project, an additional 500,000ha of conservation forest have been earmarked for notification, forest inventories are being conducted, and management plans are being drawn up (World Bank, 1988). Under the World Bank's Environmental Action Plan for Somalia, the remnant riverine forests of the Jubba valley have been established as a priority concern, while a Tropical Forestry Action Plan has recently been initiated in the country (IUCN, 1990; Stuart & Adams, 1990). The Five-year Development Programme 1987-1991 for Sudan includes increasing the area of savanna forest reserves to be brought under protection and management (World Bank, 1986), while a government/ICBP conservation programme is assisting with managing reserves (Stuart & Adams, 1990). The European Commission has funded the Natural Forest Management and Conservation Project in Uganda which supports the Forestry Department in its goal to expand nature reserves in the country, while a conservation project has begun for the degraded forests of Mount Elgon, Kibale, and Semliki (Harcourt, in press).

Overcoming Economic Constraints Funding is a major factor which limits the effective management of conservation areas. In addition to the aid projects mentioned above, the Elephant Action Plans, prepared for most countries in the subregion, identify funding and project priority areas.

Since 1987, tourism has been the largest foreign exchange earner in Kenya, with the Kenya Wildlife Service receiving KSh 130 million in 1990. It has been suggested that a Wildlife Conservation Trust be established as a long-term strategy to strengthen the Uganda National Parks and Game Department (Pomeroy, 1990).

Improving Management Within the subregion, there are several initiatives which attempt to link conservation with development in and around conservation areas. Two examples are the management of wildlife outside conservation areas by local residents under the Kenya Wildlife Service's Community Wildlife Programme, and a collaborative government/FAO/UNDP project in Somalia which has been working towards applying the benefits of conservation to local communities (Stuart & Adams, 1990). Goals of forest management in Sudan include the need to increase the area and protection of forest reserves in woodland areas, and promote multiple-use management to benefit people living near forest reserves (ESMAP, 1986). The National Rehabilitation and Development Plan 1988/89-1991/92 of Uganda includes provision for the integration of wildlife management with rural development (Uganda National Parks, 1991), while the management of forest parks will involve an Advisory Committee composed of local authorities and community leaders.

7.5.3 International Initiatives

Conventions and Programmes Most countries within the subregion participate in one or more international conventions and programmes concerned with conservation areas (Table 7.5). All countries except Djibouti and

Somalia have accepted or ratified the Convention Concerning the World Cultural and Natural Heritage, but only Ethiopia has had a natural property inscribed on the World Heritage List.

Kenya and Uganda have acceded to or ratified the Ramsar Convention, while Kenya, Sudan and Uganda all participate in the Unesco Man and Biosphere Programme. To date, five biosphere reserves have been created in Kenya. All countries of the subregion have either ratified or are signatory to the AfricanConvention, which defines several designations of conservation area.

Cooperative agreements Cooperation within the subregion is difficult due to civil unrest in a number of countries. Nevertheless, an action plan to conserve and strengthen the Mara-Serengeti ecosystem between Kenya and Tanzania, and an agreement between Sudan and Egypt to establish the Gebel Elba Conservation Area, are examples of cooperative arrangements being attempted. The existence of a number of transboundary conservation areas in the region provides a departure point for further advancements.

7.6 PRIORITIES FOR ACTION

Priorities for conservation action in the subregion were reviewed as part of the *IUCN Systems Review of the Afrotropical Realm* (Mackinnon and MacKinnon, 1986), and in the accompanying Action Strategy (IUCN, 1987), but these are somewhat dated.

Priorities have been reviewed more recently by IUCN (1992) in preparation for the IV World Parks Congress. These are generalised, recognising that translation of priorities into action will vary according to national conservation objectives, history and political will. They provide a foundation to the more specific priorities identified in this report and summarised in Table 7.6.

In conclusion, progress throughout the subregion has been hindered by civil unrest, environmental conditions (i.e. drought), and the demand on resources by rapidly growing human populations. Not surprisingly, the greatest progress has been made in those countries where these seemingly intractable problems have been minimal. Governments of the subregion are aware of the need for conservation area networks, well-funded institutions and up-to-date policy and legislation but have their hands tied by more immediate demands.

? No information

¹ National forest priority areas await legal gazettement. Although *de facto* protected areas, they are not included.

² All forest reserves (except plantations) are classified as conservation forest in view of the 1986 ban on felling of indigenous trees.

³ There are 27 'protected forests' in the country, but no data are available.

⁴ The total for natural production forest is inflated because it includes unknown amounts of protection forest, and may include some plantation forest.

Table 7.3Extent of notified and proposed conservation areas, classified by sector and national
designation. Management categories are assigned to designations based on national
legislation (P = partial protection with local, sustainable extractive uses; T = total
protection with no extractive uses). Totals for proposed sites may be inflated because
they may include areas of properties already protected but proposed for upgrading to
higher conservation status. Details of individual properties are given in Annex 7.2.
N is the total number of conservation areas.

Summary of national priorities for action relating to conservation areas. Table 7.6

COUNTRY	Legislation	Completing the network	Managing the network
Djibouti	Strengthen and broaden legislation	Extend to Mabla mountains	Develop management plans
Ethiopia	Enact legislation	Expand network by inclusion of national forest priority areas	Strengthen the Natural Resources Conservation and Development Main Department
Kenya	Update legislation	Implement systems plan and extend forest reserve network	Strengthen relationship between Kenya Wildlife Service and the Forest Department
Somalia	Update legislation	Establish representative network	Create Somali Wildlife Service
Sudan	Enact new forest legislation allowing for protection within forest reserves	Expand network to include desert and Sahelian zones	Strengthen wildlife and forestry organisations; coordination of activities throughout the country
Uganda	Update and broaden legislation	Extend ecosystem protection in the form of forest parks and nature reserves	Strengthen Uganda National Parks, and Game and Forest departments

Notes: Data provided by Omollo & Blackett, August 1991; Blackett, March, 1992.

Forest reserves in Kenya have not been classified under the forest function categories above. However, the government banned all felling of indigenous trees in 1986. Therefore, the area of forest reserves, apart from the 165,000 ha of industrial plantations, has been placed under conservation forest.

There is about 53,000 ha of nature reserves found within forest reserves and constitutes part of the total in the above table.

Notes: Data provided by Byarugaba (Forest Department), pers. comm., 21 May 1990; Kiwanuka (Forest Department), pers. comm., July 1990; Department of Environment Protection, 1992.

> The total area of nature reserves (45,509 ha) which occurs within natural production forest is included under conservation forest. Conservation forest also includes 2 protection forests (125,625 ha), 4 sites of special scientific interest (3,574 ha) and 461 savanna woodland reserves (632,000 ha).

One nature reserve constitutes the total in the proposed conservation forest category, while the 131,827 ha in the proposed production forest category is forest parks (Kiwanuka, pers. comm., 1991).

The 114,491 ha of protection forest is located in tropical high forest (production).

Several forest reserves have dual status as game reserves, animal sanctuaries or national parks

8 WEST AFRICA

8 WEST AFRICA

Benin, Côte d'Ivoire, Ghana, Guinea, Liberia, Nigeria, Sierra Leone, Togo

8.1 HISTORICAL PERSPECTIVE

Protection of nature in West Africa has its origins in oral customary law, traditional rules and taboos concerning hunting. Examples from Ghana include the protection of snails and tree species in sacred groves of the closed forest zone, and the establishment of a monkey sanctuary at Boabeng-Fiema in the Brong-Ahafo region. At Boabeng-Fiema, mona and black and white colobus monkeys are considered sacred and are protected as such.

The first protected areas were created in the early 20th century, when most of the countries in the region were under colonial rule. Colonial authorities in the subregion were Britain (Ghana, Nigeria, Sierra Leone) and France (Benin, Cote d'Ivoire, Guinea, Togo). Liberia is an exception in not having been subject to colonial rule.

8.2 NATURE CONSERVATION POLICY AND LEGISLATION

Legal provisions for the establishment of protected areas have been passed in all countries within the subregion. These are summarised in Table 8.1 and reviewed below.

Conservation areas in the subregion are designated either under the forest law, or under separate wildlife law. In both cases, designations are generally similar and follow those given in the African Convention of 1968. This provides definitions of strict nature reserve, national park and special reserve (which includes other areas such as game reserve, partial reserve, sanctuary and soil, water and forest reserve).

8.2.1 Forestry Sector

Policy Information on forest policy is only available for Ghana, Guinea, and Sierra Leone. In general, the role of forests, both in serving a conservation function and as a natural resource, is recognised in all three countries.

Legislation Forest policy and forest law in colonial Africa were based on experience from continental Europe, and reflect the idea, common at the time, that nature provides a readily exploited resource. Legislation principally concerned land tenure, and forest exploitation.

In British colonies, the early administrators followed the pattern of reservation of forest lands adopted in India. This mainly concerned establishment within a legal framework of a permanent forest estate the boundaries and use of which could only be amended by the highest authority in the land.

In francophone countries within the subregion, legislation was derived directly from France, a country with a long experience of temperate forestry. This legislation was based on the principle of Roman legislation, according to which any unoccupied land where existence of written ownership documents could not be proved, belonged to the state. All forest lands were thus declared state property, although local populations exercised many usage rights. Contradiction between oral customary law and the written regulations of the forest law resulted in a general reluctance of local people to accept the delineation of reserve forests. Since independence, French-speaking countries have tried to amend the regulations on forest ownership. However, as a general rule, the whole forest area is still considered to be state property (forêt domaniale), the concept of private forests being virtually non-existent.

Throughout francophone countries, the concept still exists of state forests comprising classified forests and protected forests. Classified forests are gazetted areas in which customary rights of use are generally permitted, but which are otherwise generally protected. Protected forests comprise that part of the state forest not subject to individual classification orders, which therefore do not appear in Table 8.1. Within protected forests,

uncontrolled clearing and unauthorised logging are forbidden, as well as the regulation of customary rights which the population could otherwise exercise without restraint.

Most current forest laws within the subregion contain some reference to the multiple role and uses of forests for environmental protection and raw material production.

Information on existing forest legislation is not available for Togo, but a new Code de la Forêt et de la Faune is due to be passed, which will make Togo the only country within the subregion not to have separate forest and wildlife legislation.

8.2.2 Wildlife Sector

Policy Information on wildlife policy is available only for Ghana, Liberia, Nigeria and Sierra Leone. In these countries, the importance of preserving wildlife is stressed. The need to ensure that local people benefit from protected areas is also recognised, for example, by permitting the use of protected areas as a source of bushmeat.

Legislation All countries within the region, other than Togo, have passed wildlife legislation designating protected areas. There is often close interlinkage between this and the forest legislation. Present nature conservation legislation in the subregion generally follows the 1968 (Algiers) African Convention. Designations are for national parks, strict nature reserves, wildlife sanctuaries, hunting reserves and sport hunting reserves, definitions of each category generally being similar throughout the region. The highest degree of protection is given in strict nature reserves, where access is only permitted for management purposes and scientific research. National parks are open to tourism, but residence is not permitted. Sanctuaries are for the protection of named species. Reserves in which hunting is permitted comprise hunting reserves, where subsistence hunting is allowed, and sport hunting reserves, where hunting for sport is permitted, usually following purchase of a permit. In general, many categories of conservation area have been defined for which there are as yet no examples on the ground.

8.2.3 Other Sectors Not applicable

8.3 MANAGED AREAS ADMINISTRATION

Departments responsible for administration of protected areas are given in Table 8.1. Categories are listed according to the language used in the original legislation. A glossary of terms (French, Portuguese and French) is given in Part I.

8.3.1 Forestry Sector

Administration of forestry is the responsibility of forest departments in the respective countries (Table 8.1). Most have histories dating back to colonial times, earlier this century. For all countries for which data is available, the forestry sector is responsible for at least some of the conservation areas.

8.3.2 Wildlife Sector

Conservation areas are generally managed under a single administrative organisation within the forest departments of countries within the subregion. The Wildlife Division has been upgraded to departmental status in Ghana, and recommendation has been made for upgrading the wildlife and national parks section in Liberia. Separate wildlife sections have not been established in Guinea or Togo, conservation areas in these countries being administered by the Forestry Sector.

8.3.3 Other Sectors

Not applicable

8.3.4 Non-Governmental Organisations

Togo provides the only example in the subregion of management being entrusted to a non-governmental organisation. Management of Fazao-Malfakassa Faunal Reserve has been passed to the F. Weber Convention for a period of 25 years, starting in 1990 (Bleich, 1991).

8.4 MANAGED AREAS STATUS

The managed areas system is mapped (where possible) for each country within the subregion, in Figs 8.1-8 (Part III). Details of individual conservation areas are given in Annex 8.1 which serves as a key to the maps.

8.4.1 Managed Areas within the Forestry Sector

Coverage Data for the subregion, although far from up-to-date, is rather more complete than for the neighbouring subregions of West Sahel and Cental Africa. Managed areas within the forestry sector account for approximately 9.4% of the total area of West Africa (Table 8.2). As available data is incomplete, this should be considered a minimum figure. Managed areas within the forestry sectors of the subregion are most extensive in Liberia (13%), although this area comprises solely production forest. By contrast, in Benin, which ranks second in this table, all the 12% of land managed within the forestry sector comprises conservation forest. Of the countries for which data was available, Togo has the lowest figure (1.8%) for managed areas within the forest sector.

8.4.2 Conservation Areas within Forestry, Wildlife and Additional Sectors

Coverage There are over 386 legally designated conservation areas in West Africa covering a total area of over 14 million ha or 6.7% of the subregion (Table 8.3). Approximately 8.7% of these conservation areas are under total protection, covering 3.1% of the subregion. The rest are partially protected. The totally protected areas tend to be much larger than the partially protected areas, such that the area covered by the two categories is roughly equal.

The 10% target of total area under protection for conservation purposes has been reached only by Benin, Cote d'Ivoire and Togo. Benin has by far the largest protected areas system within the region, due to several large reserves in the north of the country. The protected area systems of Liberia and Sierra Leone are the smallest in the subregion, covering less than 2% of each country.

Representativeness Representativeness of the protected area systems within the subregion varies widely. The systems of Cote d'Ivoire and Togo are extensive, and are considered to be adequate, particularly as most habitat types are represented. Two of the habitats protected within Cote d'Ivoire are only protected in one other country: dense humid Guinean forest in Ghana and mangroves in Senegal. The systems of Ghana, Guinea and Nigeria are comparable, although less extensive, in being fairly well dispersed throughout the countries, and representing most habitat types.

Although Benin has by far the most extensive protected areas system within the subregion, distribution is very uneven, all areas being in the north of the country, on the border with Burkina Faso and Niger.

Sierra Leone has a small protected areas system. However, when sites which are currently proposed are finally gazetted, all the vegetation types in the country will be covered.

Ecofloristic zone analysis [pending data from FAO]

Integrity Data in Table 8.4 indicate that conservation areas under the wildlife sector tend to be large or very large throughout the subregion. Mean size of totally protected areas is in all cases at least double that of partially protected areas. National parks form the bulk of the former category and, by definition, they tend to be relatively large areas to provide a range of services.

In contrast, mean size of conservation areas within the forestry sector tend to be far smaller, throughout the subregion.

Effectiveness Apart from inadequate representation of the subregion's biological diversity within existing conservation area networks, conservation efforts are limited by weaknesses in policy, legislation, institutional support and management. Existing legislation frequently needs strengthening or updating (Table 8.6). Management plans for conservation areas within the region generally do not appear to exist.

The general lack of commitment of resources for conservation areas is largely responsible for many of the deficiencies in their management, which generally is ineffective or in some cases non-existent. Enforcement is very often handicapped by the absence of clearly-demarcated boundaries that are easily recognisable on the ground. Encroachment by people is ubiquitous, few conservation areas being free of this problem.

8.4.3 Contribution of the Forestry Sector to Nature Conservation

The forestry sector is directly responsible for the vast majority (90%) of the conservation areas within the subregion, which cover a total area of approximately 7 million ha or 3.4% of the region. However, these conservation areas largely comprise classified forests, which in general are small. Therefore, the total area for which the forestry service is responsible is actually slightly less than the area covered by the 31 conservation areas for which the wildlife sector is responsible.

Data in Table 8.2 suggest that the contribution of the forestry sector to nature conservation is minimal (3.3%) in terms of the total area of the subregion under protection and conservation forest. However, this figure is almost certainly minimal, and the contribution of the forestry sector to protection and conservation is probably higher than suggested by the statistics because data are incomplete.

The contribution of the forestry sector to conservation is further underestimated, as no figures are available of the extent of protected forests, which are legislated for in all francophone countries within the subregion. Protected forests comprise virtually all land outside gazetted areas, in which felling, amongst other things is prohibited, and which thus serve a conservation function.

8.5 FUTURE PROSPECTS

8.5.1 Expanding the Conservation Area Network

There appear to be relatively few official proposals to expand the conservation area network. Figures in Table 8.3 show a total for 54 proposed sites covering 1,176,529ha or 0.6% of the total area of the subregion. Approximately equal numbers fall within the wildlife and forestry sectors, although the wildlife sector represents the bulk of the area covered.

8.5.2 Other National Initiatives

Strengthening networks No information

Overcoming Economic Constraints Funding is a major factor which limits the effective management of conservation areas throughout the region.

Improving Management Throughout the region an increase in funding is necessary to enable adequate management. Problems in recruiting sufficient trained professional staff are common. Guinea has a particular problem in having an excess of staff, who are largely unmotivated. Reducing the numbers and increasing training is considered a priority task.

8.5.3. International Initiatives

Conventions and Programmes All countries within the region, apart from Togo, participate in one or more international conventions and programmes concerned with conservation areas (Table 8.5). Only Ghana is party to the Convention on Wetlands of International Importance Especially as Waterfowl Habitat (Ramsar Convention), hence Owabi, Ghana's only Ramsar site, is the single Ramsar site within the subregion.

Cooperative Agreements Guinea and Cote d'Ivoire cooperate in the management of Mount Nimba, which is a joint World Heritage site. A Conseil d'Entente with Niger, Burkina Faso, Côte d'Ivoire and Togo provides an administrative structure for cooperation between neighbouring countries, although the relevance of this to managed areas is not clear. A proposal to set up a single authority to manage the three contiguous "W" national parks in Burkina Faso, Benin and Niger, totalling over 1 million ha, and to raise funds for its operation, is being considered.

8.6 PRIORITIES FOR ACTION

Priorities for conservation action in the subregion were reviewed in the now dated IUCN Systems review of the Afrotropical Realm (MacKinnon and MacKinnon, 1987) and the accompanying Action Strategy (IUCN, 1987).

Priorities have been reviewed more recently (IUCN, 1992) for the IV World Congress on National Parks and Protected Areas. These are generalised, recognising that translation of priorities into action will vary according to national conservation objectives, history and political will. They provide a foundation to the more specific priorities identified in this report and summarised in Table 8.6. The Sudano-Sahelian PLATFORM for Action on UNCED Negotiations and Beyond: A Contribution to the African Position (Anon, 1991), concerning environmental degradation within the Sahel, was drawn up for UNCED 1992, following two consultative meetings of 22 Sudano-Sahelian countries, including several from the West Africa subregion. The report highlights the link between poverty and mismanagement of natural resources, particularly exploitation of marginal lands and deforestation. Recommendations include action to be taken at both the international and African level.

In conclusion, progress in the subregion has been seriously hampered by the environmental conditions (i.e. drought), and the demand on resources by rapidly growing human populations. Although mostly aware of the need for conservation area networks, well-funded institutions and up-to-date policy and legislation, governments in the subregion have generally not been able to ensure these are established.

Table 8.2Extent of notified natural forests, classified by forest function. Units are in sq. km,
followed by % total area. Full data, with sources, are given in Annex X.2.

Table 8.3Extent of notified and proposed conservation areas, classified by sector and national
designation. Management categories are assigned to designations based on national
legislation (P = partial protection with local, sustainable extractive uses; T = total
protection with no extractive uses). Totals for proposed sites may include areas of
properties already protected but proposed for upgrading to higher conservation status.
Details of individual properties are given in Annex 2. N is the total number of conservation
areas.

Summary of national priorities for action relating to conservation areas. Table 8.6

COUNTRY	Legislation	Completing the network	Managing the network
Bénin		Upgrade the designation of some classified forests	Improve management. Limit human settlement in protected areas.
Côte d'Ivoire		System considered adequate	Improve management to control poaching and gold prospecting
Ghana	Review Wildlife and Protected Area legislation	Establish protected area(s) in upland evergreen forest and semi-deciduous forest	Improve management by increasing funding and recruitment of staff, particularly at higher grades
Guinea		Extend protected area system following thorough survey to identify sites. Include areas of mangrove and important coastal bird areas.	Improve management by training staff and reducing staff numbers, and controlling hunting, logging and cultivation within protected areas
Liberia	Enact 1989 draft regulations to the 1988 Wildlife & National Parks Act	Develop protected area system to comprise totally protected core areas, surrounded by multiple use zones	Management collapsed during civil war
Nigeria	State wildlife law needs revising, to differentiate between strict nature reserves and forest or game reserves	Extend protected area system to protect lowland, swamp and montane forest	Improve management to enable implementation of the national wildlife policy
Sierra Leone	Consolidate the numerous categories into fewer and more distinct classes	Extend protected area system to include protected areas proposed under the mandate of the Wildlife Conservation Branch	Recruit more professional staff into management positions in the Forestry Department and Wildlife Conservation Branch
Togo	Finalise the new Code de la Forêt et de la Faune	Extend protected area system slightly, to include corridor between Keran NP and Pendjari NP in Benin	Complete reassessment of protected area system to enable redefinition of limits and management objectives

Notes: Data are taken from B.D.Otchoun, pers.comm. 1991.

The figure for conservation forests represents 45 classified forests (see Annex 8.1). Classified forests are listed as protected areas by the Department of Forests and Natural Resources, although according to legislation (Décret No. 89–385), classified forests may be exploited if permission is granted by the Minister responsible for Water, Forests and Hunting.

The figure for protection forests represents 7 reforestation areas.

Notes:

Data are from the Forestry Commission, 1990; Forestry Department, 1990 (above totals).

Many of the producion forests have Protection Working Circles which generally consist of steep slopes and watersheds in which logging is prohibited and, therefore, serve primarily a protection function. The total area under Protection Working Circles is estimated to be 430,000ha (Gartey, 1990).

The figure for protection forests of natural origin comprises 209,623ha of forest reserve (Annex 8.1) and 430,000ha protection working circles.

Notes: Data are taken from the Forestry Research Institute, 1990 (production forest totals); Nigerian Conservaton Foundation, 1990; WCMC database (conservation forest totals).

> The figure 2,098,795 represents strict nature reserves and game reserves, which are managed and administered by each State Department of Forestry. National parks used to be administered by the Division of Wildlife and Conservation within the Federal Department of Forestry, but since 1991, have been controlled and managed by the corporate National Parks Governing Board, operating through individual National Parks Management Committees. The area of national parks is therefore excluded form the above table.

Strict nature reserves can occur within game reserves, hence the figure 2,098,795 may be an overestimate.

Notes: Data are from Frame, G.W. and Tanghanwaye, N.N. (1991). The Ministry of Environment and Tourism comprises six departments. These include the Department of National Parks, Fauna Reserves and Hunting (responsible for management of national parks and reserves, which are therefore not included in this table), and the Department of Protection and Control of Exploitation of the Flora, which is responsible for conserving the natural vegetation in all the forest reserves, and for enforcing the forest code.

> Some forest reserves are managed by the Ministry of Rural Development, which exploits natural forests and tree plantations both within and outside forest reserves.

Togo has 80 forest reserves. Approximately 28 of these, (covering 104,157ha) mainly fulfil a conservation function, and are listed here as conservation forests. A further 39 are listed here as production forests. These comprise 11 reserves (covering 29,180ha), listed as being of non-forest origin, which have been cleared of natural vegetation, and 28 (covering 38,881ha) being plantations. Remaining forest reserves lie within the faunal reserves and national parks.

9 CENTRAL AFRICA

9 CENTRAL AFRICA

Cameroon, Central African Republic, Congo, Equatorial Guinea, Gabon, Sao Tome and Principe, Zaïre

9.1 HISTORICAL PERSPECTIVE

Protection of nature in Central Africa has its origins in oral customary law, traditional rules and taboos concerning hunting.

Nature conservation legislation within the subregion still reflects the countries' colonial histories. In the Central African Republic, Congo and Gabon (previously French colonies) and Zaïre (previously a Belgian colony), policy and law were derived directly from France or Belgium (by Royal Decree of the Belgian monarch), and the long experience of temperate forestry in those countries. The situation in Cameroon, which was formed by the union of two parts formerly under British and French administrations, is more complex. Reserves in Equatorial Guinea, then a Spanish colony, were created by Ministerial Decree of the Spanish government. Sao Tome and Principe, a Portuguese colony was subject to Portuguese colonial law.

9.2 NATURE CONSERVATION POLICY AND LEGISLATION

Legal provisions for the establishment of protected areas have been passed in all countries within the subregion, other than Sao Tome and Principe, since independence. These are summarised in Table 9.1 and reviewed below.

Conservation areas in the subregion are designated either under the forest law, or under separate wildlife law. In both cases, designations are generally similar and follow those given in the African Convention of 1968. This provides definitions of strict nature reserve, national park and special reserve (which includes other areas such as game reserve, partial reserve, sanctuary and soil, water and forest reserve).

9.2.1 Forestry Sector

Policy In general, little information on forest policy is available. Sao Tome and Principe had no forest policy by 1985. In Cameroon, main objectives of the forest sector are defined under the VIe Plan de Dévéloppement for the period 1986-1991, but no policy has been formulated.

Legislation Texts from the colonial period were based on experience from continental Europe, and reflect the principle, common at the time, that nature provides a readily exploitable resource. A decree, based on France's long experience of temperate forestry, established the forestry regime in French Equatorial Africa (which included Chad, Cameroon, Central African Republic and Gabon). The original French forestry legislation was based on the principle of Roman legislation. According to this, unoccupied land, where existence of written ownership documents could not be proved, belonged to the state. All forest lands were thus declared state property, although local populations exercised many rights of use. Contradiction between the oral customary law and these written regulations led to a general reluctance of local people to accept the delineation of reserved forests.

Since independence, all francophone countries in the subregion have promulgated new forestry law, based on the earlier French legislation. The concept of state forests, comprising classified forests and protected forests, still exists. Classified forests are gazetted areas in which customary rights of use are generally permitted, but which are otherwise generally protected. Protected forests comprise that part of the state forest not subject to individual classification orders, which, therefore, do not appear in Table 9.1. Within protected forests, uncontrolled clearing and unauthorised logging are forbidden, as is the regulation of customary rights which the population could otherwise exercise without restraint.

In general, forest legislation within the subregion concerns only the large forest massifs. Clauses which concern forest outside these areas are few, and technically far behind those found in recent legislation for countries in neighbouring subregions.

The situation in Cameroon is confusing. Areas of forest were originally designated as forest reserves. New forest legislation has subsequently been passed, which provides for many designations, but not for forest reserves. Existing forest reserves are, therefore, awaiting reclassification as production or protection forests, but meanwhile continue to be known as forest reserves.

Conservation areas may be established under the forest legislation (e.g. Cameroon, the Central African Republic, Congo and Gabon). Alternatively, they may be established under separate wildlife legislation (Zaïre). The Forest Codes of Cameroon and the Central African Republic name various designations of conservation area, but definitions of these categories are only given in the subsequent wildlife laws.

Equatorial Guinea and Zaire only have fragmentary forest legislation.

9.2.2 Wildlife Sector

Policy Information on nature conservation policies is not available.

Legislation Conservation areas legislation has been promulgated within Cameroon, Central African Republic, Equatorial Guinea and Zaīre.

Designations for conservation areas, whether defined under the forest code or separate wildlife legislation, are generally the same throughout the subregion, and follow the 1968 African Convention. Categories defined include national parks, strict nature reserves, wildlife sanctuaries, hunting reserves and sport hunting reserves. The highest degree of protection is afforded to strict nature reserves, where access is only permitted for management purposes and scientific research. National parks are open to tourism, but residence is not permitted. Sanctuaries are for the protection of named species. Reserves in which hunting is permitted include hunting reserves, where subsistence hunting is allowed, and sport hunting reserves, where licensed hunting for sport is permitted.

Gabon is anomalous in that definitions of conservation areas do not follow those given in the African Convention.

Protected areas were established in Equatorial Guinea when the region was under colonial rule. Following independence these were all ignored. Eight protected areas have recently been established in the country, but information is not available concerning the legislation under which they have been gazetted. Legislation on the creation of protected areas in Sao Tome and Principe has not been passed, and needs to be established urgently.

9.2.3 Additional Sectors

Presidential reserves in the subregion are established by presidential decree.

9.3 MANAGED AREAS ADMINISTRATION

Departments responsible for administration of protected areas are given in Table 9.1. Categories are listed according to the language used in the original legislation. A glossary of terms (French, Portuguese and French) is given in Part I.

9.3.1 Forestry Sector

Within the region, there is a proliferation of state and para-statal institutions involved in the forestry sector. Individual managed areas are frequently managed by numerous organisations. In the Congo, six different ministries are involved in forest management, and in Zaïre, ten departments are involved.

In general this leads to confusion and inefficient overall management.

9.3.2 Wildlife Sector

Conservation areas have been managed traditionally under a single administrative organisation within the forest departments of respective countries within the subregion. This remains the case in the Central African Republic, Equatorial Guinea and Gabon, where conservation areas are managed by departments within the ministry responsible for forests. In Cameroon the department responsible for wildlife is in a separate ministry to that responsible for forests.

Management of conservation areas in the Congo and Zaïre is complex, many organisations being involved, which, in the Congo fall within six different ministries.

In Gabon, a para-military force of forestry and wildlife staff is directly responsible for managing reserves.

9.3.3 Additional Sectors

Officially decreed presidential reserves exist in both the Central African Republic and Gabon, under direct control of the countries' presidents.

9.3.4 Non-Governmental Organisations

No information is available on the direct involvement of non-governmental organisations in the management of protected areas within the subregion.

9.4 MANAGED AREAS STATUS

The protected areas system is mapped for each country within the subregion in Fig 9.1-7 (Part III). Details of individual conservation areas are given in Annex 9.1 which serves as a key to the maps.

9.4.1 Managed Areas within the Forestry Sector

Coverage Data for the region is generally so incomplete that general conclusions concerning the extent of managed areas within the forestry sector cannot reasonably be made. Available data is given in Table 9.2, and indicates that a minimum of 8.8% of the total area of the subregion is managed by the forestry sector, although this is considered to be a gross underestimate.

According to Table 9.2, managed areas within the forestry sector appear to be most extensive in Equatorial Guinea (11.3%). This figure represents eight recently established protected areas, which are presumed to be under the management of the forest sector.

Apart from Equatorial Guinea, the country in the subregion with the greatest area (3%) managed by the forest sector is Cameroon, virtually all of which comprises production forest. This is in contrast to the overall figures for the subregion which indicate that most of the land managed by the forest sector is allocated to protection or conservation purposes.

The contribution of the forest sector to conservation is further underestimated in the tables, as no figures are available for the extent of protected forests, which are legislated for in all francophone countries within the subregion.

Throughout the francophone countries, virtually all land outside gazetted areas is known as forêt protégee, in which felling, amongst other things is prohibited, and which thus serves a conservation function. The contribution of the forestry sector as a whole to protection and conservation is, therefore, much higher than suggested by the statistics in Table 9.2.

9.4.2 Conservation Areas within Forestry, Wildlife and Additional Sectors

Coverage There are some 209 legally designated conservation areas in the subregion covering a total of 27 million ha or 6.7% of the subregion (Table 9.3). Approximately one half of these conservation areas are under total protection, covering 3.2% of the subregion (Table 9.3). The rest are partially protected. The forestry sector is directly responsible for only 75 conservation areas, covering a total area of 3 million ha or 0.2% of the region. Bearing in mind the paucity of information available, this is certainly an underestimate.

The 10% target of total area under protection for conservation purposes has only been reached by the Central African Republic and Equatorial Guinea. Only 5.4% of Zaïre is protected. This is an important consideration, bearing in mind that this country alone accounts for 57% of the subregion. In contrast, Sao Tome and Principe have no protected areas, but as the total land area of the two islands which comprise the country only amount to less than 0.1% of the subregion, this is insignificant on a subregional level.

Representativeness No protected areas yet exist in Sao Tome and Principe. As the country consists of two islands this has greater implications than if an equally small area on the mainland was totally unprotected. Although currently 9.5% of Cameroon lies within protected areas, these are not evenly distributed. National parks were originally set up in the north, where big game could be more easily viewed in the Sudanian savanna. This region is, therefore, well represented in contrast to forest areas in the south of the country, which are much less well represented. Similarly, in Central African Republic, most protected areas are located in the northern Sudanian savanna. However, attempts have been made recently to improve the representativeness of the system with the establishment in 1990 of Dzanga-Ndoki National Park and Dzanga-Sangha Special Reserve in the extreme south-west corner in a region of rain forest. In the Congo the situation is quite different. Samples of all vegetation types except swamp forest are included within protected areas, although the area gazetted is minimal (3.9% by 1982), and, as management is virtually non-existent, these are in effect only paper parks. Until recently, Equatorial Guinea had no protected areas, the well organised areas established during colonial days having collapsed. However, nine areas have recently been accorded formal protection, theoretically establishing an effective system. Again, information available suggests that these too exist only in name. Conservation areas in Gabon are located primarily on or near the coast, with little of the east of the country being represented. In Zaïre, conservation areas are well distributed throughout the country.

Ecofloristic zone analysis [pending data from FAO]

Integrity Data in Table 9.4b indicate that conservation areas under the wildlife sector tend to be large or very large throughout the subregion, particularly in Zaïre, which has a mean size of totally protected area of over 1 million ha. Mean size of totally protected areas is in all cases almost double that of partially protected areas. National parks form the bulk of the former category which, by definition, tend to be relatively large areas and provide a range of services. The two presidential reserves listed under Additional Sector (Table 9.4c) are similarly large. In contrast, reserves managed by the forestry sector are comparatively minute with a range of 4 to 40,000ha, apart from in Zaïre which once again provides conservation areas with the largest mean size, of 141,500ha in this instance.

Effectiveness Apart from inadequate representation of the subregion's biological diversity within existing conservation area networks, conservation efforts are limited by weaknesses in policy, legislation, institutional support and management. Existing legislation frequently needs strengthening or updating (Table 9.6). Management of protected areas throughout the sub-region is inadequate or totally lacking. Management plans for conservation areas within the region generally do not appear to exist, and many protected areas are ineffective, existing only on paper. The general lack of commitment of resources for conservation areas is largely responsible for many of the deficiencies in their management. Enforcement is very often handicapped by the absence of clearly-demarcated boundaries that are easily recognisable on the ground. Encroachment by people is ubiquitous, few conservation areas being free of this problem. Poaching is a continual problem throughout the region.

Even in Gabon, management is generally low despite the country's relative affluence, an exception being the relatively well protected Wonga-Wongué Presidential Reserve. Invasion of protected areas by local populations,

which is a considerable problem elsewhere in Africa, is generally not a problem within this region, due to the comparatively low population pressure.

9.4.3 Contribution of the Forestry Sector to Nature Conservation

Preliminary data in Table 9.2 suggest that the contribution of the forestry sector to nature conservation is low (8%) in terms of the total area of the subregion under protection and conservation forest. The great majority (86%) of the conservation area network falls within the domain of the wildlife sector (Table 9.3).

The figures in Table 9.2 should be considered to be an absolute minimum. Data for the subregion was sparse, and the contribution of the forest sector to conservation is further underestimated, as no figures are available of the extent of protected forests. These are legislated for in all francophone countries within the subregion, and comprise virtually all land outside gazetted areas. Numerous activities, including felling, are prohibited, hence these forests serve a conservation function.

9.5 FUTURE PROSPECTS

9.5.1 Expanding the Conservation Area Network

The conservation area networks in all the countries within the region need to be expanded. In Cameroon, legislation states that 20% of the country should be protected, but present coverage is much less than this. Gabon is one of the few countries in the world that still offers exceptional potential for conservation. In general, the major ecosystems remain intact, and human activities are having less of an influence on the forest as people become more sedentary.

Proposals exist for the establishment of completely protected ecological zones on Sao Tome and Principe, at high altitudes, and on very steep slopes. Official proposals to expand the conservation area network throughout the region total some 1.7 million ha or 0.4 % of the total area of the subregion (Table 9.3).

9.5.2 Other National Initiatives

Strengthening networks

No information

Overcoming Economic Constraints Funding is a major factor which limits the effective management of conservation areas throughout the region, although this is much less of a problem in Gabon, which has a GNP at least double that of other countries within the sub-region.

Improving Management Management needs to be implemented, or improved throughout the sub-region.

9.5.3 International Initiatives

Conventions and Programmes All the countries within the sub-region are the subject of a regional programme "Conservation and Rational Utilisation of Forest Ecosystems in Central Africa", financed by the European Development Fund of the EC (IUCN, 1989).

Sao Tome and Principe, and Equatorial Guinea are not party to any of the international conventions listed in Table 9.5, to which other countries in the subregion belong. These comprise the 1968 (Algiers) African Convention on the Conservation of Nature and Natural Resources, the Unesco Man and the Biosphere Programme, under which biosphere reserves are established, and the Convention Concerning the World Cultural and Natural Heritage (in which all other countries in the subregion participate). Gabon is the only country within the subregion party to the Ramsar Convention, under which three wetlands have been designated, all of which encompass areas of forest. **Cooperative agreements** Zaïre has transfrontier parks with Uganda and Rwanda, in neighbouring subregions, but there does not appear to be any cooperation in management.

9.6 PRIORITIES FOR ACTION

Priorities for conservation action in the subregion, summarised in Table 9.6, were reviewed in the now dated *IUCN Systems review of the Afrotropical Realm* (MacKinnon and MacKinnon, 1986) and the subsequent action plan (IUCN, 1987). Priorities have more recently been reviewed by IUCN (1989), and IUCN (1992) in preparation for the IV World Parks Congress. These are generalised, recognising that translation of priorities into action will vary according to national conservation objectives, history and political will. They provide a foundation to the more specific priorities identified in this report and are summarised in Table 9.6.

Recommendations listed in IUCN (1989) include limiting the great diversity of institutions responsible for forest management, establishing coordination between NGOs and the forest services, and the recruitment of women, who usually play an important role in agriculture and collection of forest products, into the forest service.

The Sudano-Sahelian PLATFORM for Action on UNCED Negotiations and Beyond: A Contribution to the African Position (Anon., 1991), concerning environmental degradation within the Sahel, was drawn up for UNCED 1992, following two consultative meetings of 22 Sudano-Sahelian countries, which included Cameroon. The report highlights the link between poverty and mismanagement of natural resources, particularly exploitation of marginal lands and deforestation. Recommendations include action to be taken at both the international and African level.

In conclusion, although mostly aware of the need for conservation area networks, well-funded institutions and up-to-date policy and legislation, governments in the subregion have generally not been able to ensure these are established, which has hampered progress within the subregion.

Table 9.2Extent of notified natural forests, classified by forest function. Units are in sq. km,
followed by % total area. Full data, with sources, are given in Annex 9.2.

Table 9.3Extent of notified and proposed conservation areas, classified by sector and national
designation. Management categories are assigned to designations based on national legislation
(P = partial protection with local, sustainable extractive uses; T = total protection with no
extractive uses). Totals for proposed sites may be inflated because they may include areas
of properties already protected but proposed for upgrading to higher conservation status.
Details of individual properties are given in Annex 9.2. N is the total number of conservation
areas.

Table 9.4(c) Frequency distributions of conservation area sizes, with means, classified by management category (P = partial protection with local, sustainable extractive uses; T = total protection with no extractive uses), for (a) Forestry, (b) Wildlife and (c) Additional sectors.

Note that N (the total number of conservation areas) does not necessarily equate to N in Table 3, because the areas of some individual sites may be unknown.

Countries for which there are no relevant data are not included in the table.

Table 9.5State parties to international (and regional) conventions or programmes concerning the
conservation of natural areas, together with the number of properties (natural of mixed
natural/cultural in the case of the World Heritage Convention) recognised under respective
conventions in brackets.

	World Heritage Convention	Biosphere Reserves ¹	Ramsar Convention	African Convention
Cameroon	1982 (1)	1979 (3)	-	R
Central African Republic	1980 (1)	1977 (2)	-	R
Congo	1987 (0)	1977 (2)	-	R
Equatorial Guinea	-	-	-	-
Gabon	1986 (0)	1983 (1)	1986 (3)	S
Sao Tome and Principe	-	-	-	-
Zaire	1974 (4)	1976 (3)	-	R

¹Unesco MAB Project 8 R = ratified S = signatory Table 9.6 Summary of national priorities for action relating to conservation areas.

COUNTRY	Legislation	Completing the network	Managing the network
Сатегоол	Complete ongoing radical reform and revision of 1981 forest legislation	Increase representation of forest zone	Improve management
Central African Republic	Revise 1961 Forest Code to strengthen provision for conservation	Expand network	Improve management and enforce legislation
Congo	Revise Forest Code and pass nature conservation legislation	Expand network. Gazette reforestation areas as reserves and expand the network in the north of the country	Create one authority responsible for the management of protected areas
Equatorial Guinea		Re-establish and expand network	Instigate management
Gabon	Restore legislation to conform with the African Convention	Expand network to cover different forest ecosystems. Develop buffer zones around protected areas	Increase funding to improve management. Reorganise the Direction Générale des Eaux et Forêts and reduce departments to three. Train personnel for conservation in forest areas, as well as in the existing savanna-based school
Sao Tome and Principe	Enact conservation legislation	Establish nétwork	Instigate management
Zaire	Enact new Code Forestier, currently in preparation	Expand network	Improve management by reducing the number of organisations responsible for individual protected areas, and improving coordination between those that remain

10 TROPICAL SOUTHERN AFRICA

10 TROPICAL SOUTHERN AFRICA (including Madagascar)

Angola, Botswana, Burundi, Madagascar, Malawi, Mozambique, Namibia, Rwanda, Tanzania, Zambia, Zimbabwe

10.1 HISTORICAL PERSPECTIVE

Protection of nature, in the form of traditional creeds and superstitions, is an old tradition throughout the subregion, one notable example being the protection of mountain forests and peaks in Madagascar. The "305 Articles Code" of the Ancient Malagasy Kingdom also provided protection for forests on the island and, under this code, those who were convicted of deforestation were condemned to be chained. During the 19th century, chiefs in Zambia had traditional hunting grounds where a measure of protection was provided.

Conservation in the subregion, however, stems mainly from the creation of extensive networks in both the forestry and wildlife sectors, with forest reserves first being created around the turn of the century in Malawi, in the 1920s, 1930s, and 1940s in most other countries, and somewhat later (1970s) in Botswana. To date, no forest reserves have been established in Namibia. Significant additions to the forest reserve networks of most countries has occurred in the post-independence period.

The establishment of conservation areas in the wildlife sector follows a similar pattern, with the first game reserve being created in 1897 in Malawi, followed by those created in the early 1900s in Namibia and Tanzania, in the 1920s and 1930s in Angola, Rwanda, Zambia, Zimbabwe and Madagascar, and in the 1950s and 1960s in Mozambique and Botswana, respectively. Significant additions to these wildlife sector networks occurred in the majority of countries from the 1950s onwards. In most countries, national parks were established somewhat later than game reserves, and Burundi represents one of very few African countries where no national park was established during the colonial period. The majority of conservation areas in the wildlife sector of Malawi were created from previously established forest reserves.

National monuments, which serve primarily to protect natural features, were first created in Zambia in the 1940s, Victoria Falls being a prominent example. National monuments, and legislation allowing for their creation, were established in the 1960s for both Malawi and Namibia.

Nature conservation is in various stages of development throughout the subregion. Legislation allowing for the creation of forest reserves exists in all countries, with the possible exception of Namibia. Further, all countries have legislation providing for the creation of conservation areas in the wildlife sector, most of which conform to international standards, the exception being Angola where conservation areas are established under individual laws (IUCN, 1987a). Apart from Madagascar, where the situation is under review, each country has distinct agencies or departments which are responsible for conservation areas in the forestry and wildlife sectors, respectively.

10.2 NATURE CONSERVATION POLICY AND LEGISLATION

Legislation exists for the creation and management of conservation areas in all countries of Tropical Southern Africa. These are summarised in Table 10.1 and reviewed below.

10.2.1 Forestry Sector

Policy Forest policy has been developed for a number of countries in the subregion, reflecting the dual purposes of protection and management for sustainable use. The need to increase the area under reservation is also stated. For example, the national constitution of Namibia (1989) outlines state policy on the conservation and sustainable use of natural resources. This is complimented by the Nationhood Programme for an Independent Namibia, which emphasises the environmental and economic role of forests. In addition, the recently approved National Forest Policy states that 10% of the country's land area will be managed as state forests. Similarly, the government of Zambia has set a target to increase the area of state-managed forests to

at least 15% in the future. In Malawi, the Department of Forestry's "Statement of Development Policies (1987-1996)" is currently guiding the management and control of the forest estate, while the accompanying fiveyear action plan (1988-1992) has identified a number of priority strategies including initiatives in community forestry and cooperation with other countries in the development of forest resources.

Legislation Within Tropical Southern Africa, early legislation allowing for the creation of forest reserves dates back to 1921 in Tanzania, the 1930s in Madagascar and Rwanda, the 1940s in Malawi, Zambia and Zimbabwe, and the mid-1950s in Mozambique. In almost all cases, these early acts have either been amended or new legislation adopted, mostly in the 1970s and 1980s. Forestry legislation has recently been passed in Botswana (1976) and Burundi (1989), while the origin and date of legislation creating forest reserves in Angola is unknown.

Early legislation in Rwanda, and probably in a number of other countries in the subregion, made provision for the exploitation of timber resources in the interests of European settlers, while leaving Rwandanese nationals free to cut wood in accordance with customary rights. Most forest reserve networks today, however, have been established with both exploitation and conservation in mind, and, in the case of Tanzania, the development of management plans for forest reserves is stipulated in its legislation.

Present forestry legislation throughout the subregion allows for the creation of one or more forest reserve designations, outlines provisions relating to forest exploitation and management, establishes management authorities, and sets out offences and accompanying penalties in connection with forest resources and reserves. Related and subsidiary legislation to the principal acts exists in most countries, notable among these being the Acquisition of Land for Public Purposes Ordinance No.19 (1948) of Malawi, which enables the proclamation of public lands, subsequently gazetted as forest reserves.

In no less than six countries (Botswana, Malawi, Rwanda, Tanzania, Zambia and Madagascar), the principal forest acts make provision for the establishment of private forest reserves, local authority forest reserves, community forests or village forests. These categories are generally governed by the same regulations set out for government reserves, and are usually managed by local authorities. Zimbabwe is unique in that it has distinct legislation governing the conservation and sustainable use of communal land.

All but Mozambique and Madagascar have distinct wildlife and forestry laws. In Botswana, hunting is allowed within the forest reserve network, while in Zambia national parks are classified as conservation forests by the Forestry Department.

10.2.2 Wildlife Sector

Policy Most countries within the subregion have formulated, or are in the process of developing nature conservation policies which emphasise the importance of conservation areas in protecting wildlife and natural habitat. For example, the Wildlife Conservation Policy of Botswana, 1986 emphasises the importance of national parks and reserves, wildlife management areas, and the rational use of wildlife. Similarly, Malawi's Wildlife Policy Statement, 1963 contains provisions for the protection of wildlife and natural habitat, the control of hunting, and for conservation education programmes. Somewhat more extensive, the Ministry of Wildlife, Conservation and Tourism in Namibia has recently set out a number of aims and objectives for the next decade, including the development and maintenance of a network of conservation areas which will contain at least 10% of each habitat type, the proclamation of marine reserves, and the development of master plans and management policies for each conservation area.

A second feature of many policies within the subregion is an emphasis on the role conservation areas play in support of rural development. For example, the Director of Wildlife (1991) stated that the overall conservation goal of Tanzania is to integrate wildlife conservation with rural development, and to maintain a viable network of conservation areas which will benefit rural people and provide for the conservation of flora and fauna. Likewise, the policies of Zambia and Zimbabwe, respectively, emphasise the protection and management of the parks and wildlife estate, and promote wildlife management as an economic form of sustainable resource use. Currently, the development of a national environmental policy is a priority area in Angola.

Legislation Within the subregion, the majority of countries had pre-independence laws relating to wildlife conservation and the creation of conservation areas in the wildlife sector. Early examples include the passing of the first game law in Botswana in 1891, legislation passed in Rwanda (1925) which allowed for the creation of Virunga National Park, the 1925 Game Ordinance of Zambia, a decree of 1927 which established the first nature reserves in Madagascar, the Game and Fish Preservation Act, 1929 of Zimbabwe, and the "Regulamento", 1936 of Angola, which allowed for the establishment of national parks and reserves. These were subsequently amended or repealed, most recently in the 1970s (Angola, Botswana, Malawi, Mozambique, Rwanda, Tanzania, and Zambia), or 1980s (Burundi, Namibia, and Zimbabwe).

There is recognition of the need to draft new conservation area legislation for Angola, while revision of the natural resources acts in Malawi is ongoing. The proposed Wildlife Conservation and National Parks Bill of Botswana is being promulgated and will amalgamate the existing Fauna Conservation Act and the National Parks Act, while the National Parks and Wildlife Act of Zambia has been redrafted and is currently before parliament. These new pieces of legislation will either create or redefine conservation area designations.

Present nature conservation legislation in the subregion commonly provides for the establishment of national parks, game/nature reserves, sanctuaries, controlled hunting areas, and strict (integral) nature reserves. Other categories found include the international game park of Zambia, national recreation area of Namibia, and a single piece of legislation providing for the establishment and management of Ngorongoro Conservation Area in Tanzania. National parks and strict nature reserves tend to afford the highest degree of protection, while controlled hunting areas the least throughout the subregion. Wildlife management areas and game management areas, which are a feature of Botswana and Zambia, respectively, provide for conservation, local utilisation of wildlife resources, and often serve as buffer zones to the more strictly protected designations. In Zimbabwe, a number of parks and reserves are a part of the estate of the late Cecil John Rhodes and as such are also covered by the terms of the Rhodes Estate Act of 1978.

10.2.3 Additional Sectors

In Tanzania, the creation and management of marine reserves is provided for by the Fisheries Act No. 6, 1970, and the accompanying regulations of 1975. National monuments legislation has been passed in Burundi, Malawi, Namibia, and Zambia.

10.3 MANAGED AREAS ADMINISTRATION

10.3.1 Forestry Sector

Administration of forestry is the responsibility of forest departments or services within the subregion. Exceptions to this are Botswana and Tanzania, where forestry is administered at the divisional level, Namibia, where a Forestry Directorate exists, and Zimbabwe where a Forestry Commission is the managing authority (Table 10.1). Most have a long institutional history, dating from the turn of the century in a number of countries.

Unlike all other countries of the subregion, where there are distinct agencies which administer conservation areas in the forestry and wildlife sectors, respectively, the Administration Forestière of Madagascar is responsible for all conservation areas. In Namibia, the Forestry Directorate will be responsible for the management of forest reserves when the necessary enabling legislation is introduced.

10.3.2 Wildlife Sector Many of the original game departments in the subregion were established for tsetse control and have since assumed conservation responsibilities. Further, the management of conservation areas today is closely tied to tourism in many countries.

With the exception of Madagascar, management of conservation areas in the wildlife sector is the responsibility of the respective wildlife departments. Today, these departments, apart from those in Angola and Mozambique, operate independently of their respective forestry administrations. For example, jurisdiction lies with the Department of Wildlife and National Parks in Botswana, and with the Office of Tourism and National Parks in Rwanda. Somewhat unique are Burundi, where management responsibility lies with the National Institute for the Environment and the Conservation of Nature; Mozambique, where Eduardo Mondlane University manages the partially-protected Inhaca Island; and Tanzania, where three agencies have management authority: the Division of Wildlife, which is responsible for game reserves and game controlled areas; Tanzania National Parks; and the Ngorongoro Conservation Area Authority. In addition, while the majority of game reserves are controlled on a regional basis in Tanzania, seven are considered national projects and come directly under the management of the Wildlife Division.

Management of conservation areas in the wildlife sector is linked closely to rural development in a number of countries. For example, responsibilities of the National Parks & Wildlife Service of Zambia include management of the Administration Management Design Programme for Game Management Areas, and the wildlife component of the Luangwa Integrated Rural Development Project, while the Department of National Parks & Wildlife Management of Zimbabwe oversees the Communal Areas Management Programme for Indigenous Resources projects throughout a number of districts in the country.

10.3.3 Additional Sectors

The creation and management of national monuments is the responsibility of the National Monuments Council in Namibia and the National Heritage Conservation Commission in Zambia, respectively. The Fisheries Division in the Ministry of Tourism, Natural Resources and Tourism, Tanzania, manages the seven marine reserves in the country.

10.3.4 Non-Governmental Organisations

While there are no local NGOs which are exclusively responsible for the management of conservation areas, the Kalahari Conservation Society of Botswana funds projects relating to protected areas, the Wildlife Society of Zimbabwe promotes the establishment of wildlife areas, and the East Africa Wildlife Society and the Wildlife Conservation Society of Tanzania support the management of reserves in that country.

10.4 MANAGED AREAS STATUS

The managed areas system is mapped for each country within the subregion in Fig. 10.1-13. Details of individual conservation areas are given in Annex 10.1 which also serves as a key to the maps. The bulk (over 90%) of the conservation areas network (by total area) falls within the domain of the wildlife sector (Table 10.3).

10.4.1 Managed Areas within the Forestry Sector

Coverage Natural reserved forests account for at least 5.2% of the total area of Tropical Southern Africa (Table 10.2). They are most extensive in Tanzania (14.2%), Rwanda (12.7%), Madagascar (10.6%), and Zambia (9.6%), the latter having over 450 notified reserves. The reserved forest networks of all other countries in the subregion cover less than 10% of the respective country, while there are no notified reserves in Namibia.

Of the 5.2% of natural reserved forests in the subregion, the majority (about 72%) are allocated for commercial production purposes (Table 10.2). All reserved forests in Mozambique, however, serve a conservation purpose, those in Malawi and Burundi are all considered protection forests, and 75% of the forest estate in Madagascar is set aside for protection purposes.

10.4.2 Conservation Areas within Forestry, Wildlife and Additional Sectors

Coverage There are more than 650 notified conservation areas in Tropical Southern Africa, covering a total area of 99.9 million ha or 16% of the subregion (Fig. 10.1). The forestry sector is directly responsible for over 370 conservation areas, covering a total area of approximately 9.1 million ha or 1.4% of the subregion. Most of these lie in Madagascar (279) and Malawi (70). The total coverage of conservation areas under additional sectors is minimal.

Approximately 13% of conservation areas are under total protection, covering 4.4% of area in the subregion (Table 10.3). Most of these fall within the wildlife sector. The rest are partially protected.

The target of 10% of total area under protection for conservation purposes has been reached by eight of eleven countries of the subregion, including Zambia (29.7%), Tanzania (28.5%), Rwanda (21.0%) and Botswana (17.6%), which all have extensive conservation area networks. Least extensive are those of Burundi and Angola, both of which are about half way towards reaching the target. About 57% of the conservation area in Zambia and about 45% of the area in Tanzania, however, is tied up in game management areas and game controlled areas, respectively, which make minimal provision for habitat protection.

Representativeness In a number of countries in the subregion, nature conservation areas have been established haphazardly in the past, with little regard to ecological or other criteria for their selection. This is reflected in the existing networks of Angola, where conservation areas were established first in zones of low agricultural or economic potential, and Burundi, where the current conservation area system is comprised mostly of montane habitat. In contrast, Botswana supports 14 major ecosystem types, nine of which are represented in national parks and game reserves (Hannah *et al.*, n.d.). Forest reserves in the country are found primarily in dry woodland types.

In Madagascar, the establishment of conservation areas, beginning with the selection of ten nature reserves in 1927, was to provide a representative sample of the many ecological features of the island (IUCN/UNEP/WWF, 1987). Despite this intent, only about 8% of the country is included within the conservation area network, and not all native terrestrial forest communities are afforded protection. Fourteen additional sites have been proposed to extend protection to the south-west and centre-east, to mangrove and wetland habitat, and to coral reefs (Nicoll and Langrand, 1989).

Protection of the biotic communities in Malawi is extensive. Of the 29 communities recognised by Shaxson (1977), examples of 18 occur in conservation areas of the wildlife sector, while a number of others are found in the forest reserve network (Clarke and Bell, 1986). Extended protection to the deciduous miombo woodlands and the evergreen forest biome are considered priorities, among others. In Mozambique, increased protection is needed in highland and coastal forests, while in Namibia, the Ministry of Wildlife, Conservation & Tourism has set a target of protecting 10% of each habitat type (Grobler, 1991). In Tanzania, where conservation areas cover nearly 30% of its total area, recommendations to extend the conservation areas network to montane and lowland forests, and to establish conservation areas on Pemba and Zanzibar have been formulated (IUCN, 1987b; Stuart & Adams, 1990).

Zambia has a good conservation area network covering most major habitat types (MacKinnon & MacKinnon, 1986). Nevertheless, inadequately protected habitats include a number of montane habitats, and isolated patches of lowland and gallery forest in the north-west (MacKinnon & MacKinnon, 1986; Stuart & Adams, 1990). In Zimbabwe, additional protection has been recommended for lowland forest, quartz grassland and forest, and Parinari forests.

Integrity Using mean size as a measure of integrity, data in Table 10.4 indicate that forest reserves serving a conservation or protection function in Malawi and Zimbabwe tend to be small, the majority being less than 10,000ha in size. In contrast, the reserves of Botswana, although small in number, have a mean size in excess of 30,000ha. Totally protected sites (strict nature reserves) under the jurisdiction of the Administration Forestière of Madagascar have a mean size larger than 50,000ha. Extrapolating from Table 10.3, forest reserves serving a conservation or protection function in Mozambique tend to be large, with a mean size exceeding 135,000ha.

In the wildlife sector, the partially and totally protected conservation areas of Angola, Botswana, Mozambique, and Namibia tend to be few in number but large in size, with means in excess of 300,000ha for each country. Both Tanzania and Zambia have respectable numbers of partially and totally protected areas, again with means larger than 300,000ha. The totally protected sites of Malawi, Rwanda, and Zimbabwe have mean sizes (>100,000ha) which are considerably larger than those of their respective partially protected sites, while conservation areas in Burundi tend to be on the small side. Conservation areas in additional sectors in the subregion are all afforded partial protection and are small in size. The mean size of totally protected areas (51,776ha) in the forestry sector, made up exclusively of strict nature reserves, is about four times that of partially protected sites (12,980ha), comprising mostly forest reserves. In the wildlife sector, the mean size of totally protected areas (353,825ha) is slightly larger than that for partially protected sites (329,060ha). National parks constitute the bulk of the former category, and by definition tend to be relatively large areas to provide a range of services. Partially protected areas comprise mainly game/nature reserves, sanctuaries, and controlled hunting areas. Significantly, conservation areas in the wildlife sector tend to be considerably larger than those in the forestry sector.

Effectiveness Apart from gaps in the representation of the subregion's biological diversity within existing conservation area networks, conservation efforts are limited by weaknesses in policy and legislation, inadequate institutional support and ineffective management.

As mentioned in Section 10.2, nature conservation policies in the forestry sector have been formulated at least in Malawi, Namibia, and Zambia, while the majority of countries in the subregion have nature conservation policies in the wildlife sector.

For a number of countries, legislation needs strengthening or updating. For example, wildlife legislation in Angola is in urgent need of revision, particularly when one considers that the existing designations of conservation area do not conform to international standards (IUCN, 1987a). In Botswana, the proposed Wildlife Conservation and National Parks Bill will upgrade a number of conservation areas, and make provisions for legally established wildlife management areas in the country. In Malawi, a weakness of forestry legislation is that nearly all of the country's statutes were enacted prior to independence and occasionally revised in the 1960s (Vardy, 1982). A new act governing natural resources management in Malawi is being prepared. Significantly, new forestry legislation (since 1980), allowing for the creation of various forest reserve designations, has been passed in Burundi, Rwanda, Tanzania and Zimbabwe. Enactment of conservation area legislation is hampered in a number of countries by civil unrest or lack of resources.

Institutional resources for conservation area management are inadequate for almost all countries within the subregion. Constraints include a lack of adequately trained staff, funds, resources, and in one or two cases, an infrastructure which is almost non-existent for the management of conservation areas. These problems are most acute in Burundi, Mozambique, and Angola, where, in the latter, the Forestry Development Institute operates on less than US\$ 20,000 per year for conservation areas management (IDF, 1991). Further hindrances to conservation area management are poor communication and transportation networks in a number of countries, rendering many sites inaccessible. A lack of coordination between agencies managing conservation areas has been identified as a problem in several countries of the subregion.

Low priority and a general lack of commitment of resources for conservation areas is largely responsible for many of the deficiencies in their management. This situation is exacerbated by countries having an unclear programme or weak planning of their conservation area networks. Very few conservation areas of the subregion have management plans. The majority of conservation areas in Angola and Mozambique, and game controlled areas in Tanzania exist on paper only, while Jolly (1990) has noted that many of the conservation areas in Madagascar are protected in name only, most being unprotected from land and animal poachers. Exceptions to these general trends are found in Namibia and Malawi, where conservation areas are well managed. In the case of Malawi, a master plan for national parks and wildlife, and protected area plans for conservation areas in the northern, central and southern regions were prepared in the early 1980s (Clarke, 1983 a,b,c,d; Mackinnon & Mackinnon, 1986; Stuart & Adams, 1990). Further, Botswana is actively managing its forest reserves, and has adopted a high cost/low volume tourism policy for the reserves, envisaging that considerable financial and ecological dividends will be realised in the long-term (Modise, pers. comm., 1991).

Common threats to the subregion's conservation areas include subsistence and commercial poaching, the growth of human settlements, illegal grazing, shifting cultivation, the unauthorised extraction of timber, fuelwood and minor forest products, uncontrolled bushfires, and in the cases of Botswana, Namibia, and Zambia, mineral prospecting. Other threats include rice cultivation in Malawi, hydroelectric developments and the expansion of industrial activities in Zambia, and forest swamp reserves are under threat from drainage plans in Namibia. These threats are compounded by rapidly growing populations in the subregion, and civil unrest in a number of countries.

10.4.3 Contribution of the Forestry Sector to Nature Conservation

Data in Table 10.2 indicate that the contribution of the forestry sector to nature conservation is small (1.4%) in terms of the total area of the subregion under protection and conservation forest. This percentage, however, represents minimum coverage as data are not available for all countries. For example, an unknown amount of commercial forest area in Zambia serves a protection function in guarding hilly slopes and sources of streams or rivers. Nevertheless, over 90% of the conservation area network falls within the domain of the wildlife sector, covering 14.4% of total area of the subregion (Table 10.3).

10.5 FUTURE PROSPECTS

10.5.1 Expanding the Conservation Area Network

Official proposals to expand the conservation area network total 14.6 million ha or 2.3% of the total area of the subregion (Table 10.3). These improvements to the network affect 10.7 million ha in Botswana, 1.3 million ha in Malawi, and 1.5 million ha in Mozambique. The establishment of wildlife management areas in Botswana will form buffer zones around most national parks and game reserves. Other significant extensions to existing national networks are planned for Madagascar and Tanzania, while extended protection will come about in Namibia through the creation of more conservation areas in the wildlife sector and the notification of forest reserves.

10.5.2 Other National Initiatives

Strengthening networks A variety of initiatives to strengthen conservation areas planning and management are being implemented or formulated. In Rwanda, a project entitled "Tourisme et Parcs Nationaux" ran from 1974 to 1990, the principal objectives being to develop infrastructure and tourism in conservation areas, and to provide equipment and technical assistance in park planning and management. Following this, a new programme is currently being planned (ORTPN, 1991). The Elephant Conservation Plan for Angola outlines a three-phase programme spread over the next five years. Actions within this programme include the establishment of an effective conservation area network and the creation of a state wildlife and conservation authority. In addition, regional Southern African Development Coordination Conference sub-sector proposals include infrastructure development in conservation areas of Angola (IDF, 1991). In Madagascar, IUCN and WWF are giving considerable support to improving the management of parks and reserves. As of 1991, there were no fewer than 29 separate WWF projects in the country. The World Bank, interested in the commercial possibilities of the proposed Kruger/Limpopo International Park, is considering a US\$ 12 million loan to Mozambique to get the scheme started (Caplan, 1991). In Tanzania, the Report on the Conservation of Ecosystems and Genetic Resources under the Tropical Forestry Action Plan contains a "Conservation Action Plan", drawn up for forest areas, which includes a number of projects for certain key areas, notably closed forest and mangrove forest (Bensted-Smith and Msangi, 1989). Other multi-agency projects include the planning and development of marine and terrestrial protected areas in the country.

Overcoming Economic Constraints Funding is a major factor which limits the effective management of conservation areas. In addition to the aid projects mentioned above, the Elephant Action Plans, prepared for most countries of the subregion, indicate funding and project priority areas.

In Namibia, income from hunting, tourism, and wildlife products is second only to the mining and fishing industries (Berry, 1990), while in Rwanda, tourism, based on the national parks, has been promoted vigorously and was the third largest foreign exchange earner in 1988 (Perlez, 1988; Wilson, 1991). Total earnings for the Wildlife Division in Tanzania were about US\$ 2.6 million, while Tanzania National Parks earned over US\$ 3.5 million, and Ngorongoro Conservation Area Authority received over US\$ 1.84 million in revenue in 1990 (WD, 1991). In total, Tanzania earns more than US\$ 70 million from wildlife in the form of tourism, sport hunting, live animal trade, and, formerly, from ivory (ITC, 1989). Further, the Tanzania Wildlife Protection Fund channels funds and other facilities to national organisations involved in wildlife management.

Under the Communal Areas Management Programme for Indigenous Resources projects in Zimbabwe, considerable revenue is being accrued by management trusts involved in community management. As of 1990, the estimated total revenue from hunting safaris in these areas was about US\$ 4 million, of which approximately 50% accrued directly to the districts involved (Metcalf, 1990). US-AID and WWF have provided support for the Administration Management Design programme for game management areas in Zambia, while wildlife management areas are being developed through the Natural Resources Management Project funded by US-AID in Botswana. In response to economic constraints, the Direcção Nacional de Florestas e Fauna Bravia is currently considering privatising the management of Mozambique's wildlife resources (Ministerio de Agricultura, 1991).

Improving Management Within the subregion, there are numerous initiatives which attempt to link conservation with development in and around conservation areas. Two examples include the goal to integrate protection and management into rural development programmes in Angola, and the development of wildlife management areas in Botswana to allow for conservation and controlled utilisation of wildlife outside conservation areas. In Madagascar, the World Bank has targeted the country in a pilot cooperative venture to integrate conservation and economic growth. An "Environmental Action Plan" has been drawn up, one of its features being the equal division of funds: half in support of conservation in reserves, and half to the local people (Jolly, 1990).

Integrated rural development programmes that include provision for local communities to benefit from wildlife have been in operation in several parts of Malawi for some time, and it has been suggested that these programmes be extended to the Lower Shire Valley (Stuart & Adams, 1990). Further, the Department of Forestry's current five-year action plan (1988-1992) has identified initiatives in community forestry and is encouraging multiple land use systems as priority strategies. In Rwanda, recommendations have been made to develop a scheme to involve local people in the management of conservation areas, while in Tanzania it has been proposed to set aside wildlife management areas and to develop wildlife-based industries for the benefit of village communities and the private sector (WD, 1991). Further, Ngorongoro Conservation Area in Tanzania was established as a multiple use management area to promote the conservation of wildlife and other natural resources and the interests of the 25,000 resident Masai pastoralists.

Currently, two major parallel initiatives testing different models for involving local communities in sustainable use of wildlife resources in Zambia are the Administration Management Design Programme for Game Management Areas and the Luangwa Integrated Rural Development Project (Lungu, 1990). The former provides a national policy framework for community-based wildlife conservation and management, linking wildlife benefits to local communities for conservation in game management areas. By comparison, the latter is more encompassing and is intended to be a multi-sectoral project for economic development of agriculture, forestry, fisheries, water resources and infrastructure (Lungu, 1990). In Zimbabwe, the buffer zone concept was introduced in 1960, and considerable emphasis is placed on the role of conservation areas in raising rural living standards and generating revenue through domestic and foreign tourism and utilisation of wildlife (Child, 1984). Outside conservation areas, the Communal Areas Management Programme for Indigenous Resources projects have been initiated in at least thirteen districts of the country. Half the revenue realised from sport hunting and other activities on such lands accrues directly to the districts involved, the other half to the respective management trusts (Metcalf, 1990).

10.5.3 International Initiatives

Conventions and Programmes Most countries within the subregion participate in at least one international convention or programme concerned with conservation areas (Table 10.5). All countries except Angola, Botswana, Namibia, and Rwanda have accepted or ratified the Convention Concerning the World Cultural and Natural Heritage (World Heritage Convention). Of those countries which are party to the Convention, only Burundi and Mozambique have not had natural properties inscribed on the World Heritage List.

Zambia is the only country of the subregion to have acceded to or ratified the Convention on Wetlands of International Importance especially as Waterfowl Habitat (Ramsar Convention), while Madagascar, Rwanda and Tanzania participate in the Unesco Man and the Biosphere Programme. To date, two biosphere reserves have been accepted in Tanzania, one in Rwanda, and one in Madagascar.

All countries of the subregion, with the exceptions of Angola, Namibia, and Zimbabwe, have either ratified or are signatories to the African Convention, which provides for the establishment of several conservation area designations. Most countries are members of the Southern African Development Coordination Conference (SADCC) and the Southern African Regional Commission for the Conservation and Utilisation of the Soil (SARCCUS), which both have sectors responsible for the conservation and management of natural resources.

Cooperative agreements Despite a number of security problems in the subregion, there are no fewer than thirteen transfrontier conservation areas between countries in and around Tropical Southern Africa. Botswana is currently considering a collaborative programme for the management of the contiguous Gemsbok National Park (Botswana) and Kalahari Gemsbok National Park of South Africa, and is assessing a number of sites for potential transborder parks with its other neighbours. Mozambique and the Southern African governments of South Africa, Zimbabwe, and Swaziland are discussing the creation of the Kruger/Limpopo International Park, which, if established, would comprise one of the largest national parks in the world (Ministerio de Agricultura, 1991).

10.6 PRIORITIES FOR ACTION

Priorities for conservation action in the subregion were reviewed as part of the IUCN Systems review of the Afrotropical Realm (MacKinnon and MacKinnon, 1986), and in the accompanying Action Strategy (IUCN, 1987b), but these are somewhat dated.

Priorities have more recently been reviewed in IUCN (1992) in preparation for the IV World Parks Congress. These are generalised, recognising that translation of priorities into action will vary according to national conservation objectives, history and political will. They will provide a foundation to the more specific priorities identified in this report and summarised in Table 10.6.

In conclusion, progress throughout the subregion has been variable, ranging from the well established and managed conservation areas of Malawi and Namibia to the almost non-existent networks of Angola and Mozambique. Not surprisingly, much of this situation is a direct reflection of the political stability in the first two cases and the civil unrest in the latter two. Other countries of the subregion fall in between these two extremes. Governments of Tropical Southern Africa are well aware of the need to integrate rural development with conservation, and have made remarkable progress in initiating such programmes in and around conservation areas of the subregion.

Table 10.2Extent of notified natural forests, classified by forest function. Units are in sq. km,
followed by % total area. Full data, with sources, are given in Annex 10.2.

¹ A more thorough breakdown of conservation forest into non-forest and plantation categories is not available (see Annex 10.2.2). The totals for natural forest under conservation, therefore, <u>may</u> be inflated.

² The breakdown of natural forest into protection function, and/or the distinction between conservation and protection forest, is not available.

³ Total for conservation/protection forest is underestimated because the extent of conservation working circles is not included.

Table 10.3Extent of notified and proposed conservation areas, classified by sector and national
designation. Management categories are assigned to designations based on national
legislation (P = partial protection with local, sustainable extractive uses; T = total
protection with no extractive uses). Totals for proposed sites may be inflated because they
may include areas of properties already protected but proposed for upgrading to higher
conservation status. Details of individual properties are given in Annex 10.2. N is the total
number of conservation areas.

All protected areas fall under the jurisdiction of the Direction des eaux et forêts. Production forests include forest reserves (124) and forest stations (1). Conservation forests include national parks (6), strict nature reserves (11), special reserves (23), hunting reserves (4), reforestation and restauration areas (77), and classified forests (158).

Notes: The forest reserve network is comprised of 49 production reserves, 70 protection reserves, and 88 proposed protection reserves. All production forests (plantations) have conservation working circles within them which are either selectively felled or left undisturbed. No data is currently available on the area of working circles left unexploited. Protection forests serve protection and conservation functions. A breakdown of this by area has not however been provided.

According to legislation, the 14 forest reserves in the country serve mainly a conservation function.

An earlier estimate (FAO, 1981) stated that there were 11 forest reserves covering a total area of 410,300 ha.

TOTAL			es: Data provided by Hilbert, 1990; Erkkilä & Siiskonen, 1992; Finne, 1992. The recently approved National Forest Policy states that 10% of the country's land area will be managed as state forests. Some areas have already been demarcated and are treated as forest reserves (Finne, 1992). Further information on these areas is, however, not available.

IUCN (1992) has stated that about 45% of forest reserves are closed to timber production. This is not reflected in the above table. The 1,600,000 ha of conservation forest are primarily water catchments. A number of forest reserves are located in game reserves. The total area for conservation areas in the country may, therefore, be inflated (Table 10.3).

Notes: Data provided by Chakanga (Forest Department), pers. comm., 11 July 1991.

'Protected' and 'commercial' forests may be either national or local forests.

'Protected' forests (5,884,516 ha natural, 512 ha plantation) are mostly productive forests protecting sources of streams or rivers, or located on hilly terrain to guard against soil erosion (Chakanga, pers. comm., 1991). In the above table, therefore, these forest are considered to be production forests.
